Callbacks

Department of Computer Science
University of Maryland, College Park
Callback

• **Definition**
  • Executable code passed as argument to other code
  • Examples:
    • Timer
    • Function that prints table and has as parameters a number of rows and a second function that defines the data to print (e.g., square roots, factorials, etc.)

• **Approach**
  • Higher-level code passes function as argument to lower-level code
    • In Java, pass object implementing interface
    • In C/C++, pass pointer to function
  • Lower-level code invokes callback function to perform desired task
Callback

- **Motivation**
  - Keeps code separate
    - Clean division between higher & lower-level code
  - Promotes code reuse
    - Lower-level code supports different callbacks
  - Supports event-driven programming
    - Lower-level code registers function as handler

- **Other Examples**
  - Observer pattern → Observer.update( )
  - Visitor pattern → Visitor.visit( )
  - A function that prints a formatted table for values computed with different functions
