CMSC 330: Organization of Programming Languages

Equality, Mixin Inheritance, Miscellany
Object Copy vs. Reference Copy

Consider the following Ruby code

```
x = "groundhog" ; y = x
```

Which of these occur?

Object copy

```
x (reference)  "groundhog" (object)
y     "groundhog"
```

Reference copy

```
x (reference)  "groundhog" (object)
y     "groundhog"
```
Object Copy vs. Reference Copy (cont.)

- For
  - Ruby does a reference copy (Java does, too)
  
    \[
    x = "groundhog" ; y = x
    \]

- But for
  - Ruby would cause an object copy
  - Unnecessary in Java since Strings are immutable

    - Can you explain why immutability implies copies are unnecessary?
Physical vs. Structural Equality

Consider these examples again:

- The references, or the contents of the objects they point to?
- If objects are compared (structural equality), both are true

If we compare x and y, what is considered?
- The references, or the contents of the objects they point to?
- If references are compared (physical equality), the left example is false but the right one is true

x (reference) → "groundhog" (object)

y (reference) → "groundhog"
String Equality

- In Java, `x == y` is physical equality, always
  - Compares references, not string contents

- In Ruby, `x == y` for strings uses structural equality
  - Compares contents, not references
  - `==` is a method that can be overridden in Ruby!
  - To check physical equality, use the `equal?` method
    - Inherited from the `Object` class

- It’s always important to know whether you’re doing a reference or object copy
  - And physical or structural comparison
## Comparing Equality

<table>
<thead>
<tr>
<th>Language</th>
<th>Physical equality</th>
<th>Structural equality</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Java</strong></td>
<td><code>a == b</code></td>
<td><code>a.equals(b)</code></td>
</tr>
<tr>
<td><strong>Ruby</strong></td>
<td><code>a.equal?(b)</code></td>
<td><code>a == b</code></td>
</tr>
<tr>
<td><strong>Ocaml</strong></td>
<td><code>a == b</code></td>
<td><code>a = b</code></td>
</tr>
<tr>
<td><strong>Python</strong></td>
<td><code>a is b</code></td>
<td><code>a == b</code></td>
</tr>
<tr>
<td><strong>Scheme</strong></td>
<td><code>(eq? a b)</code></td>
<td><code>(equal? a b)</code></td>
</tr>
<tr>
<td><strong>Visual Basic .NET</strong></td>
<td><code>a Is b</code></td>
<td><code>a = b</code></td>
</tr>
</tbody>
</table>
Quiz 1: Which is true?

a) Structural equality implies physical equality
b) Physical equality implies structural equality
c) Physical equality does not work for cyclic data structures
d) == always means physical equality
Quiz 1: Which is true?

a) Structural equality implies physical equality
b) Physical equality implies structural equality
c) Physical equality does not work for cyclic data structures
d) == always means physical equality
Comparisons

- Sorting requires ability to compare two values
- Ruby comparison method `<>`
  - -1 = less
  - 0 = equals
  - +1 = greater

Examples
- 3 <=> 4 returns -1
- 4 <=> 3 returns +1
- 3 <=> 3 returns 0
Two ways to sort an Array

- Default sort (puts values in ascending order)
  - `[2,5,1,3,4].sort`  # returns `[1,2,3,4,5]`

- Custom sort (based on value returned by code block)
  - `[2,5,1,3,4].sort { |x,y| y <=> x }`  # returns `[5,4,3,2,1]`
  - Where -1 = less, 0 = equals, +1 = greater
  - Code block return value used for comparisons
Quiz 2: What is the output?

print

\[1,4,7,3,2\].sort { |x,y| (x % 2) <=> (y % 2) }

• Recall that % is the modulus operator
• And <=> is the built in comparison operator

A. [1, 2, 3, 4, 7]
B. [4, 2, 1, 7, 3]
C. [1, 7, 3, 4, 2]
D. [7, 4, 3, 2, 1]
Quiz 2: What is the output?

```
print
[1,4,7,3,2].sort { |x,y| (x % 2) <=> (y % 2) }
```

- Recall that `%` is the modulus operator
- And `<=>` is the built in comparison operator

a) [1, 2, 3, 4, 7]
b) [4, 2, 1, 7, 3] — evens, then odds, in original order
c) [1, 7, 3, 4, 2]
d) [7, 4, 3, 2, 1]
Ranges

- **1..3** is an object of class `Range`
  - Integers between 1 and 3 inclusively

- **1...3** also has class `Range`
  - Integers between 1 and 3 *but not including 3 itself*.

- Not just for integers
  - ‘a’..’z’ represents the range of letters ‘a’ to ‘z’
  - **1.3...2.7** is the *continuous* range [1.3, 2.7)
    - `(1.3...2.7).include? 2.0  #=> true`

- **Discrete** ranges offer the `each` method to iterate
  - And can convert to an array via `to_a`; e.g., `(1..2).to_a`
Mixins

- Inheritance is one form of code reuse

- Another form of code reuse is “mix-in” inclusion
  - include A “inlines” A’s methods at that point
    - Referred-to variables/methods captured from context
    - In effect: it adds those methods to the current class

- To define a mixin, use a module for A, not class
Ruby Modules

- A module is a collection of methods and constants
  - Module methods can be called directly
    - So module defines a namespace for those methods
  - Instance methods are “mixed in” to another class

```ruby
module Doubler
  def Doubler.base  # module method
    2
  end
  def double      # instance method
    self + self
  end
end

Doubler.base => 2
Doubler.class  => Module
Doubler.new    #err, no method
Doubler.double #err, no method
Doubler.instance_methods
  => [:double]
```
Mixin Modules

module Doubler
  def double
    self + self
  end
end

class Integer # extends Integer
  include Doubler
end

10.double => 20

class String # extends String
  include Doubler
end

"hello".double => "hellohello"

Inserts instance methods from Doubler into the class Integer
When you call method \textit{m} of class \textit{C}, look for \textit{m}

1. in class \textit{C} …
2. in \textit{mixin} in class \textit{C} …
   • if multiple mixins included, start in \textit{latest mixin}, then try earlier (\textit{shadowed}) ones …
3. in \textit{C}'s superclass …
4. in \textit{C}'s superclass \textit{mixin} …
5. in \textit{C}'s superclass's superclass …
6. …
module M1
def hello
  "M1 hello"
end
end

module M2
def hello
  "M2 hello"
end
end

class A
  include M1
  include M2
  def hello
    "A hello"
  end
end

a = A.new
a.hello
  => "A hello"
a.class.ancestors
  => [A, M2, M1, Object, Kernel, BasicObject]
Quiz 3: What is the output?

module M1
  def hello
    "M1 hello"
  end
end

module M2
  def hello
    "M2 hello"
  end
end

class A
  include M1
  include M2
end

• class A does not have a method hello.
• Both M1 and M2 have a method hello. M2's hello shadows M1's.

a = A.new
puts a.hello

a. "A hello"
b. "M1 hello"
c. "M2 hello"
d. (nothing)
Quiz 3: What is the output?

```ruby
module M1
  def hello
    "M1 hello"
  end
end

module M2
  def hello
    "M2 hello"
  end
end

class A
  include M1
  include M2
end
```

- class A does not have a method `hello`.
- Both M1 and M2 have a method `hello`. M2's `hello` shadows M1's.

```ruby
a = A.new
puts a.hello
```

a. "A hello"
b. "M1 hello"
c. "M2 hello"
d. (nothing)
Mixin Example 3

```ruby
module M1
  def hello
    "m1 says hello, " + super
  end
  def what
    "Mary"
  end
end

class A
  def hello
    "A says hello, " + what
  end
  def what
    "Alice"
  end
end

class B < A
  include M1
  def hello
    "B says hello, " + super
  end
  def what
    "Bob"
  end
end

b = B.new
b.class.ancestors => [B, M1, A, Object, Kernel, BasicObject]
b.hello =>
B says hello, m1 says hello, A says hello, Bob
```

B's hello is called. super called B's superclass M1's hello. super in M1's hello called hello in superclass A. At the end, the "what" method of the current object "b" is called.
Mixins: Comparable

class OneDPoint
  attr_accessor :x
  include Comparable

  def <=>(other)  #used by Comparable
    if @x < other.x then return -1
    elsif @x > other.x then return 1
    else return 0
    end
  end
end
end

p = OneDPoint.new
p.x = 1
q = OneDPoint.new
q.x = 2
x < y  # true
puts [y,x].sort
# prints x, then y
class MyRange
    include Enumerable   #map, select, inject, collect, find

    def initialize(low,high)
        @low = low   #(2,8)
        @high = high
    end
    def each  #used by Enumerable
        i=@low
        while i <= @high
            yield i
            i=i+1
        end
    end
end
Ruby Summary

- Interpreted
- Implicit declarations
- Dynamically typed
- Built-in regular expressions
- Easy string manipulation
- Object-oriented
  - Everything (!) is an object
- Code blocks
  - Easy higher-order programming!
  - Get ready for a lot more of this...

Makes it quick to write small programs

Hallmark of scripting languages
Other Scripting Languages

- Perl and Python are also popular scripting languages
  - Also are interpreted, use implicit declarations and dynamic typing, have easy string manipulation
  - Both include optional “compilation” for speed of loading/execution

- Will look fairly familiar to you after Ruby
  - Lots of the same core ideas
  - All three have their proponents and detractors
  - Use whichever language you personally prefer
