Section:

TAs:

Write pseudocode for a program that computes the sum of the even numbers from user-provided values. The program will first read the number of values (N) that the user will input. It will then process the N values from user input, one by one. Finally, it will print the sum.

To keep things simple, you can read in the next integer and store it in some variable x as follows:

```
x = read()
```

You can print a value x or message as follows:

```
print(x)    or    print("Hello")
```

You do not need to implement any Java code for this problem, just the pseudocode. Remember, pseudocode should be detailed enough that it can be converted by a competent programmer into Java, but should not contain Java-specific details.

WRITE YOUR PSEUDOCODE ON THIS PAGE.
