Welcome to CMSC 434
Douglas Adams

Ford flipped the switch which he saw was now marked "Mode Execute Ready" instead of the now old-fashioned "Access Standby" which had so long ago replaced the appallingly stone-aged "Off"

*Excerpt from: So Long, and Thanks For All the Fish*
Why do you think this sign is posted?

Are there really any other options available? Why list them all?

Which talk would you go to?

Logie and AI SEMmum

November 31, 10:35 am
Room AYW 2400

Diane Litman

"Misconceptions, Contradictions and Privacy in Speech Dialogue Systems"

Understanding how people react when they interact with spoken dialogue systems is crucial in improving the performance of these systems. In particular, spoken queries provide several important indications of the user’s intent, and these can be interpreted correctly or incorrectly. In this talk, I will discuss how the user’s intent is established in spoken dialogue systems and how this understanding is used to improve the performance of these systems. The talk will also cover the role of spoken dialogue systems in the context of speech recognition and natural language processing. The talk will conclude with some ideas for future research in this area.

The seminar is presented by Diane Litman, who is a professor in the Computer Science Department at the University of Pennsylvania. The seminar will be held in Room AYW 2400 on November 31, at 10:35 am. The seminar is open to all interested individuals.
Which graphic tells the clearer story?

The letters A through G represent chemicals. The numbers 1 through 10 represent crops. Black = Improved White = Got worse

## Bleeding Edge?

- OLEDs, data gloves, implanted devices, more advanced biometrics, autonomous agents, …
What’s a computer? What’s a peripheral device?
If you asked someone to draw a computer, what parts would they draw?

Would the CPU be among them?
- are keyboards & terminals are just artifacts of today’s technologies?
- how will new input/output devices continue to change the way we interact with computers?

Is an iPhone a computer? An iPad? A dSLR?

Is a FitBit a computer? A peripheral device?

Everything old is new again?
The first mouse was in the early 1960s – 20 years before the Xerox Star or Apple Mac or Microsoft Mouse. Are today’s mice significantly different from Douglas Engelbart’s? How? Will tomorrow’s mice be significantly different from today’s? Will we even still have them?

Pen-based input dates back to the late 1950s – almost 40 years before the Apple Newton and almost 50 years before the Microsoft TabletPC push and 60 years before the stylus resurgence.

Alan Kay presented the idea of a “DynaBook” in 1968, almost 40 years before the successful wave of tablets.

What moves technology from research labs and pet projects into the business world and home use?
Empathy

Human needs and thoughts: Crucial to Understand

User-centered design
Task-centered design
Joy-centered design
For example, how do we create a menu?

Do we want a simple design or a complex design?

Should it be narrow and deep or should it be broad and shallow?

Some questions to ask:

- how many things can the typical user remember
  - there can be speed advantages for expert users that have learned where things are on a menu
- are there costs associated with loading a new page
  - an application such as Microsoft Word
    - how much memory does the machine have
  - a series of web pages
    - how much latency if there in the connection
“Make it Usable” can’t be an add-on thought…

http://dilbert.com/strip/2001-04-14

Human Computer Interaction
A discipline concerned with the design, implementation, and evaluation of interactive computing systems for human use.

Ideally, this is an iterative process:

Design

Evaluate

Implement
Course Team Project Structure
Projects will be done in groups of 3 or 4 students and have multiple graded phases and sub-phases.

As each phase is assigned, its value towards the whole will be published as well.

Each phase will have peer assessment and that will impact individual student grades.

Why have an interface design process?
Many (most?) large software projects go over cost…
When asked, managers gave four usability-related reasons:
– users requested changes
– designers overlooked tasks
– users did not understand their own requirements
– insufficient user-developer communication and understanding

Usability engineering is part of software engineering (ie: CMSC435)
• pay a little now, or pay a lot later!
• far too easy to jump into detailed design that is:
  – founded on incorrect requirements
  – has inappropriate dialogue flow
  – is not easily used
  – is never tested until it is too late
**Cost to fix a problem?**

![Cost to fix a problem graph](image)

**The time during development that you notice a change needs to be made**

---

**Some Foundations for Interaction Design**

Understanding *users* and their *tasks*

Designing *with the user*

- User centered design and prototyping
- Evaluating interfaces with users: qualitative and quantitative

Understanding *issues in visual interfaces*

- Psychopathology/psychology of everyday things
  - what makes visual design work
- Beyond screen design
  - representations and metaphors
- Graphical screen design
  - the placement of interface components on a screen

Implementing Graphical User Interfaces (GUIs)

Understanding the past and thinking about the future of HCI
Some Course Objectives

By the end of this course, outcomes should include…

• having a better definition of what “good design” means.
• being more familiar with a variety of design guidelines and models and how to apply them.
• understanding the value of understanding users and their tasks and the different methods for involving the user in the design process and have applied them in your work.
• having created the specifications for, and built a prototype of, an application using good design methods.
• knowing how to evaluate an interface design’s quality.
• having learned enough about HCI to learn even more about HCI!

How you will be evaluated

Team Project: 40%
- Projects will be done in groups of 3 or 4 students and have multiple graded phases and sub-phases.

Exams: 40%
- There will be a midterm and a final.
- The final might have some material that was covered earlier in the term.

Homework, class participation, polls/quizzes: 20%
Various things will contribute to this portion of the grade.
Examples include:
- Participation in various exercises done during class time.
- The Hall of Fame presentations (details to be given in class).
- Likely 4-6 homework assignments, accounting for roughly half of these points.

See posted syllabus for more details…
Text and additional references

Required readings:
Will be posted to the class site and ELMS site associated with the course as the term progresses.

Primary course web site:

Some recommended readings will come from:
Designing the User Interface: Strategies for Effective Human-Computer Interaction, 6th Edition Shneiderman/Plaisant/et.al.

Note: Some of the things in the 5th edition are in different places and there are some new things in the 6th edition, but I think for the types of readings that would be optional from DTUI and the goals, it feels like the 5th edition could be ok too. I'd say if you have a strong interest in HCI, it might be more worthwhile having the newer one since reading beyond just what I cover could be useful in a larger scope.

Readings for the week:
Excerpts from Don Norman’s The Design of Everyday Things (excerpts on ELMS in the Readings folder under Files)

If you find these of interest, I recommend the book in general.
