# CMSC 330: Organization of Programming Languages

# Regular Expressions and Finite Automata

#### How do regular expressions work?

- What we've learned
  - What regular expressions are
  - What they can express, and cannot
  - Programming with them
- What's next: how they work
  - A great computer science result

# Languages and Machines

CMSC 330 Spring 2020

#### A Few Questions About REs

- How are REs implemented?
  - Given an arbitrary RE and a string, how to decide whether the RE matches the string?
- What are the basic components of REs?
  - Can implement some features in terms of others
    - > E.g., e+ is the same as ee\*
- What does a regular expression represent?
  - Just a set of strings
    - This observation provides insight on how we go about our implementation
- ... next comes the math!

#### **Definition: Alphabet**

- An alphabet is a finite set of symbols
  - Usually denoted Σ
- Example alphabets:
  - Binary:  $\Sigma = \{0,1\}$
  - Decimal:  $\Sigma = \{0,1,2,3,4,5,6,7,8,9\}$
  - Alphanumeric:  $\Sigma = \{0-9, a-z, A-Z\}$

#### **Definition: String**

- A string is a finite sequence of symbols from Σ
  - ε is the empty string ("" in Ruby)
  - |s| is the length of string s
    - $\rightarrow$  |Hello| = 5,  $|\varepsilon|$  = 0
  - Note
    - Ø is the empty set (with 0 elements)
    - $\triangleright \emptyset \neq \{ \epsilon \}$  (and  $\emptyset \neq \epsilon$ )
- Example strings over alphabet  $Σ = {0,1}$  (binary):
  - 0101
  - 0101110
  - 3 •

#### Definition: Language

- A language L is a set of strings over an alphabet
- Example: All strings of length 1 or 2 over alphabet Σ = {a, b, c} that begin with a
  - L = { a, aa, ab, ac }
- Example: All strings over  $\Sigma = \{a, b\}$ 
  - L = { ε, a, b, aa, bb, ab, ba, aaa, bba, aba, baa, ... }
  - Language of all strings written Σ\*
- Example: All strings of length 0 over alphabet Σ
  - L = { s | s ∈ Σ\* and |s| = 0 }
     "the set of strings s such that s is from Σ\* and has length 0" = {ε} ≠ Ø

#### Definition: Language (cont.)

- Example: The set of phone numbers over the alphabet  $\Sigma = \{0, 1, 2, 3, 4, 5, 6, 7, 9, (, ), -\}$ 
  - Give an example element of this language (123) 456-7890
  - Are all strings over the alphabet in the language?
  - Is there a Ruby regular expression for this language?
     /\(\d{3,3}\)\d{3,3}-\d{4,4}/
- Example: The set of all valid (runnable) Ruby programs
  - Later we'll see how we can specify this language
  - (Regular expressions are useful, but not sufficient)

#### Operations on Languages

- Let Σ be an alphabet and let L, L<sub>1</sub>, L<sub>2</sub> be languages over Σ
- Concatenation L<sub>1</sub>L<sub>2</sub> is defined as
  - $L_1L_2 = \{ xy \mid x \in L_1 \text{ and } y \in L_2 \}$
- Union is defined as
  - $L_1 \cup L_2 = \{ x \mid x \in L_1 \text{ or } x \in L_2 \}$
- Kleene closure is defined as
  - $L^* = \{ x \mid x = \varepsilon \text{ or } x \in L \text{ or } x \in LL \text{ or } x \in LLL \text{ or } \ldots \}$

#### **Operations Examples**

```
Let L_1 = \{ a, b \}, L_2 = \{ 1, 2, 3 \} (and \Sigma = \{a,b,1,2,3\})
```

- $\blacktriangleright$  What is  $L_1L_2$ ?
  - { a1, a2, a3, b1, b2, b3 }
- ▶ What is  $L_1 \cup L_2$ ?
  - { a, b, 1, 2, 3 }
- $\blacktriangleright$  What is L<sub>1</sub>\*?
  - { ε, a, b, aa, bb, ab, ba, aaa, aab, bba, bbb, aba, abb, baa, bab, ... }

# Quiz 1: Which string is **not** in L<sub>3</sub>

$$L_1$$
 = {a, ab, c, d,  $\varepsilon$ } where  $\Sigma$  = {a,b,c,d}  
 $L_2$  = {d}  
 $L_3$  =  $L_1$  U  $L_2$ 

A.a

B. abd

C. E

D.d

# Quiz 1: Which string is **not** in L<sub>3</sub>

$$L_1$$
 = {a, ab, c, d,  $\varepsilon$ } where  $\Sigma$  = {a,b,c,d}  
 $L_2$  = {d}  
 $L_3$  =  $L_1$  U  $L_2$ 

A. a

B. abd

C.E

D. d

## Quiz 2: Which string is **not** in L<sub>3</sub>

$$L_1 = \{a, ab, c, d, \epsilon\}$$
 where  $\Sigma = \{a,b,c,d\}$   
 $L_2 = \{d\}$   
 $L_3 = L_1(L_2^*)$ 

A.a

B. abd

C.adad

D.abdd

## Quiz 2: Which string is **not** in L<sub>3</sub>

$$L_1 = \{a, ab, c, d, \epsilon\}$$
 where  $\Sigma = \{a,b,c,d\}$   
 $L_2 = \{d\}$   
 $L_3 = L_1(L_2^*)$ 

A.a

B. abd

C. adad

D.abdd

#### Regular Expressions: Grammar

Similarly to how we expressed Micro-OCaml we can define a grammar for regular expressions R

$R := \emptyset$	The empty language
3	The empty string
σ	A symbol from alphabet Σ
$R_1R_2$	The concatenation of two regexps
$R_1 R_2$	The union of two regexps
R*	The Kleene closure of a regexp

#### Regular Languages

- Regular expressions denote languages. These are the regular languages
  - aka regular sets
- Not all languages are regular
  - Examples (without proof):
    - > The set of palindromes over Σ
    - $> \{a^nb^n \mid n > 0\}$  (a<sup>n</sup> = sequence of *n* a's)
- Almost all programming languages are not regular
  - But aspects of them sometimes are (e.g., identifiers)
  - Regular expressions are commonly used in parsing tools

## Semantics: Regular Expressions (1)

• Given an alphabet  $\Sigma$ , the regular expressions over  $\Sigma$  are defined inductively as follows

#### **Constants**

regular expression	denotes language
Ø	Ø
3	{3}
each symbol σ ∈ Σ	<b>{σ}</b> )

Ex: with  $\Sigma = \{a, b\}$ , regex a denotes language  $\{a\}$  regex b denotes language  $\{b\}$ 

## Semantics: Regular Expressions (2)

Let A and B be regular expressions denoting languages L<sub>A</sub> and L<sub>B</sub>, respectively. Then:

#### **Operations**

regular expression	denotes language
AB	$L_AL_B$
A B	L <sub>A</sub> U L <sub>B</sub>
A*	L <sub>A</sub> *

There are no other regular expressions over Σ

#### Terminology etc.

- Regexps apply operations to symbols
  - Generates a set of strings (i.e., a language)
    - (Formal definition shortly)
  - Examples
    - a generates language {a}
    - > a|b generates language {a} ∪ {b} = {a, b}
    - $\triangleright$  a\* generates language  $\{\epsilon\} \cup \{a\} \cup \{aa\} \cup ... = \{\epsilon, a, aa, ... \}$

If s ∈ language L generated by a RE r, we say that r accepts, describes, or recognizes string s

#### Precedence

- Order in which operators are applied is:
  - Kleene closure \* > concatenation > union

```
    ab|c = (ab)|c → {ab, c}
    ab* = a (b*) → {a, ab, abb ...}
    a|b* = a | (b*) → {a, ε, b, bb, bbb ...}
```

- We use parentheses () to clarify
  - E.g., a(b|c), (ab)\*, (a|b)\*
  - Using escaped \( (if parens are in the alphabet )

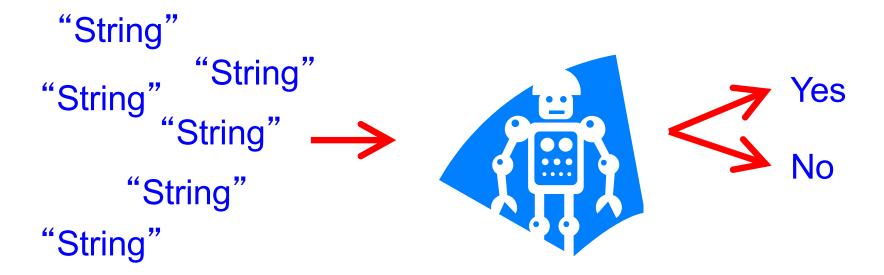

#### Ruby Regular Expressions

- Almost all of the features we've seen for Ruby REs can be reduced to this formal definition
  - /Ruby/ concatenation of single-symbol REs
  - /(Ruby|Regular)/ union
  - /(Ruby)\*/ Kleene closure
  - /(Ruby)+/ same as (Ruby)(Ruby)\*
  - /(Ruby)?/ same as (ε|(Ruby))
  - /[a-z]/ same as (a|b|c|...|z)
  - / [^0-9]/ same as (a|b|c|...) for a,b,c,... ∈ Σ {0..9}
  - ^, \$ correspond to extra symbols in alphabet
- ➤ Think of every string containing a distinct, hidden symbol at its start and at its end these are written ^ and \$ CMSC 330 Spring 2020

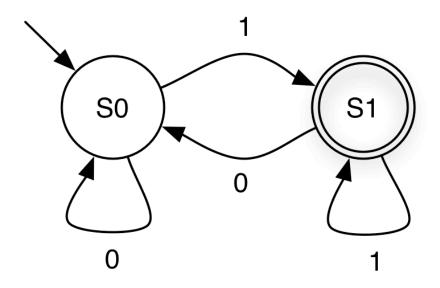

22

## Implementing Regular Expressions

- We can implement a regular expression by turning it into a finite automaton
  - A "machine" for recognizing a regular language

#### **Finite Automaton**

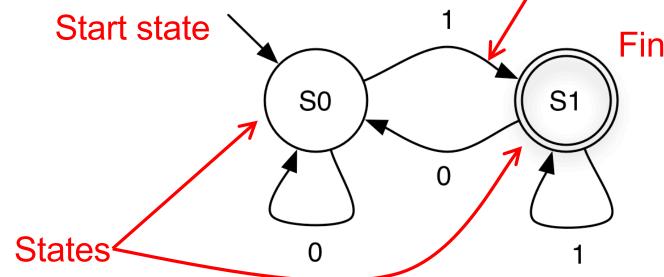

#### **Elements**

- States S (start, final)
- Alphabet Σ
- Transition edges δ

#### **Finite Automaton**

Transition on 1

Final state

#### **Elements**

- States S (start, final)
- Alphabet Σ
- Transition edges δ

- Machine starts in start or initial state
- Repeat until the end of the string s is reached
  - Scan the next symbol  $\sigma \in \Sigma$  of the string s
  - Take transition edge labeled with σ
- String s is accepted if automaton is in final state when end of string s is reached

#### Finite Automaton: States

#### Start state

- State with incoming transition from no other state
- Can have only one start state

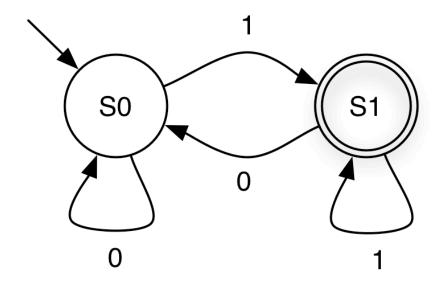

States with double circle

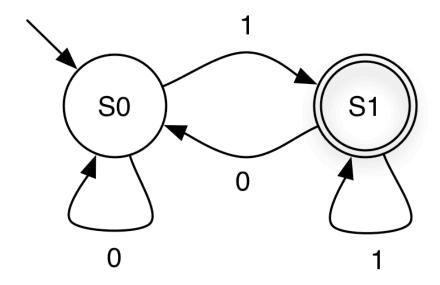

- Can have zero or more final states
- Any state, including the start state, can be final

001011

Accepted?
Yes

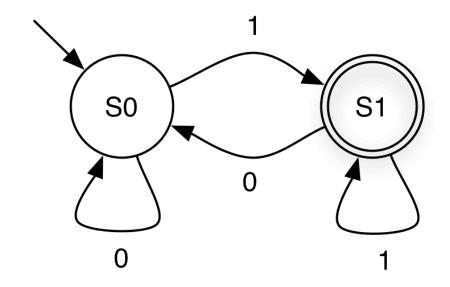

001010

Accepted?

No

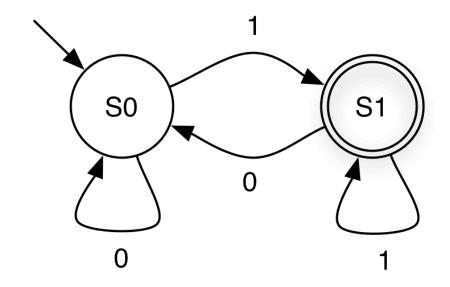

#### Quiz 3: What Language is This?

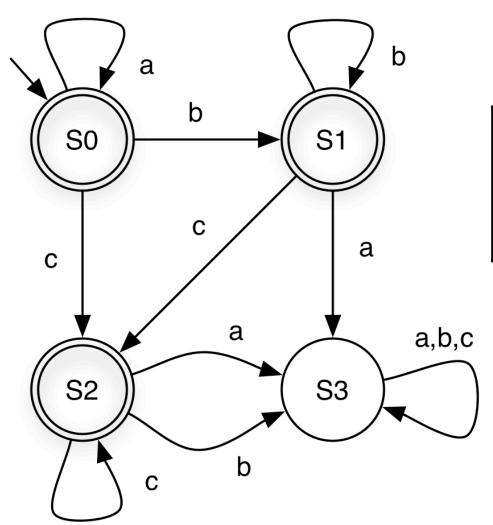

- A. All strings over {0, 1}
- B. All strings over {1}
- C. All strings over {0, 1} of length 1
- D. All strings over {0, 1} that end in 1

CMSC 330 Spring 2020

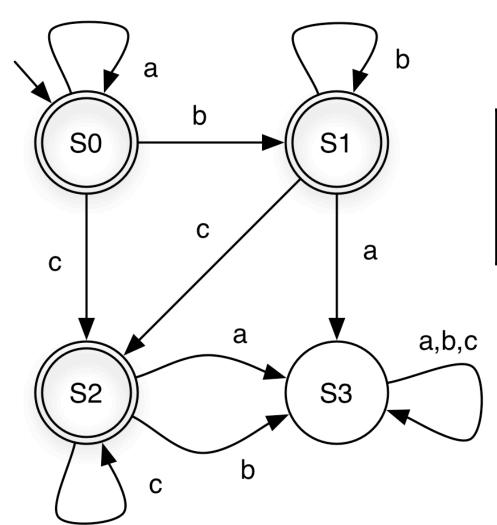

#### Quiz 3: What Language is This?

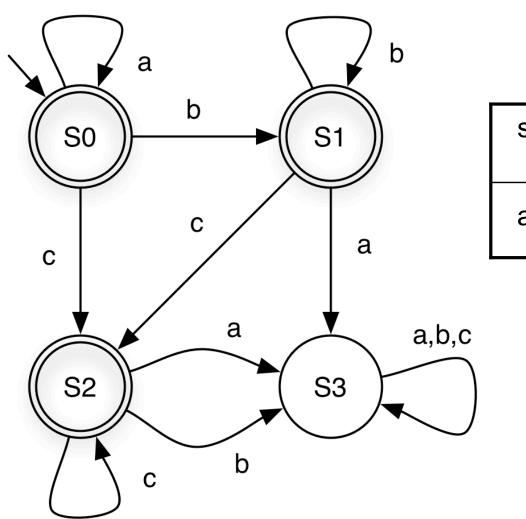

- A. All strings over {0, 1}
- B. All strings over {1}
- C. All strings over {0, 1} of length 1
- D. All strings over {0, 1} that end in 1 regular expression for this language is (0|1)\*1

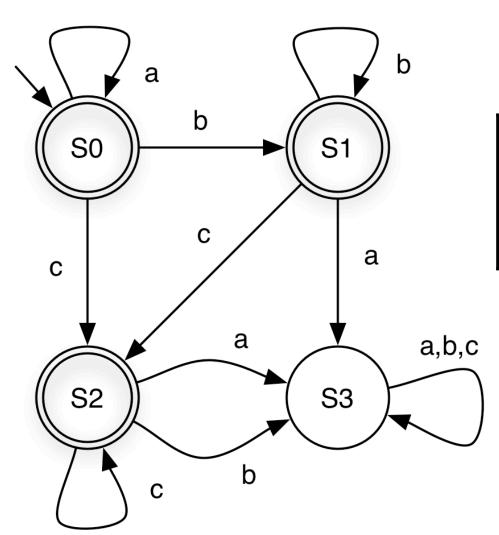

string	state at end	accepts ?
aabcc		

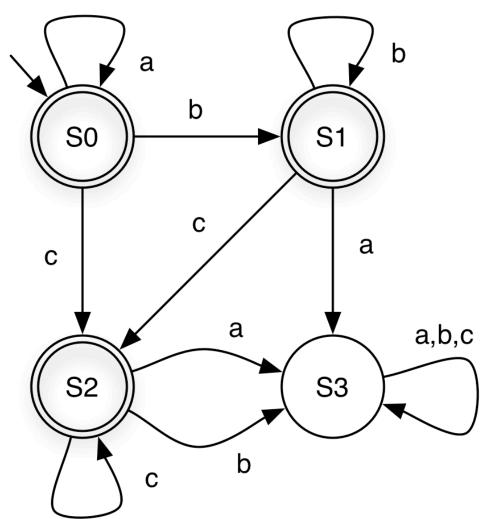

string	state at end	accepts ?
aabcc	S2	Y

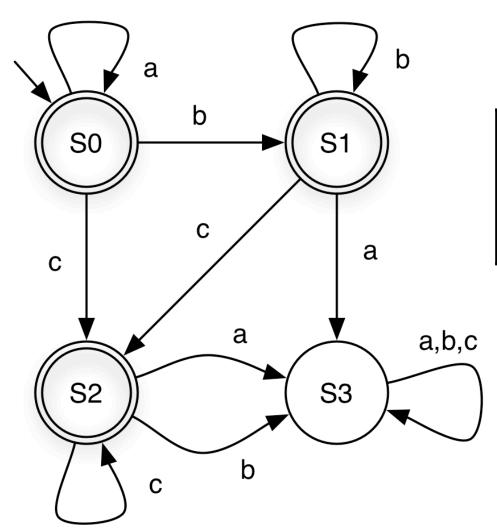

string	state at end	accepts ?
acca		

string	state at end	accepts ?
acca	<b>S</b> 3	N

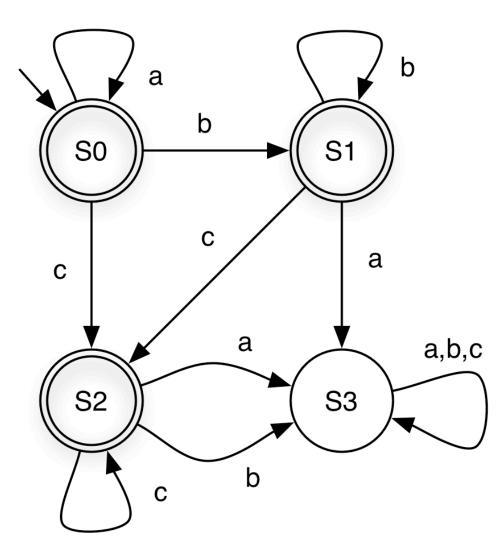

string	state at end	accepts ?
aacbbb		

string	state at end	accepts ?
aacbbb	S3	N

#### Quiz 4: Which string is not accepted?

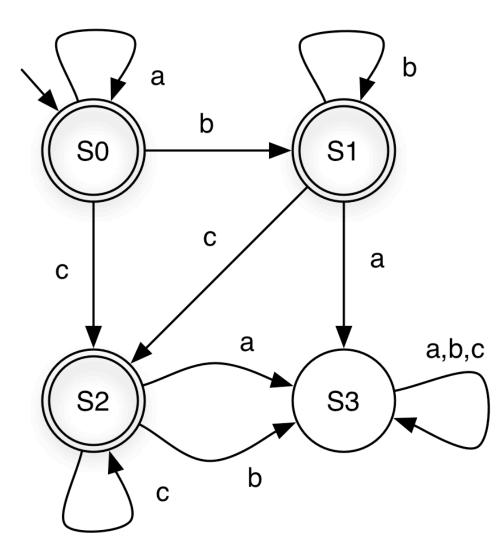

A. bcca

B. abbbc

C. ccc

D.  $\epsilon$ 

## Quiz 4: Which string is not accepted?

A. bcca

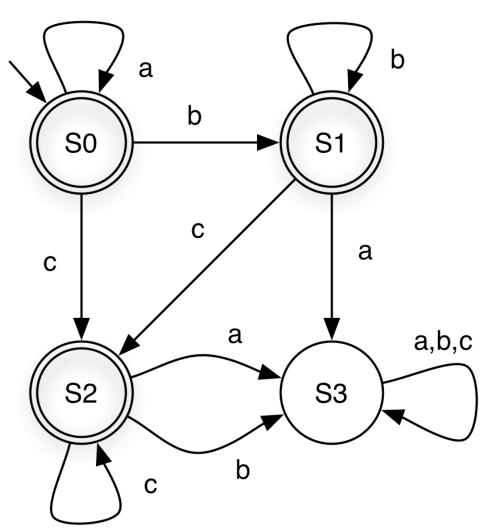

B. abbbc

C. ccc

D.  $\epsilon$ 

(a,b,c notation shorthand for three self loops)

## Finite Automaton: Example 3

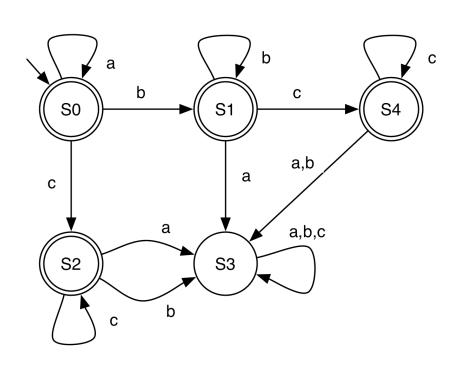

What language does this FA accept?

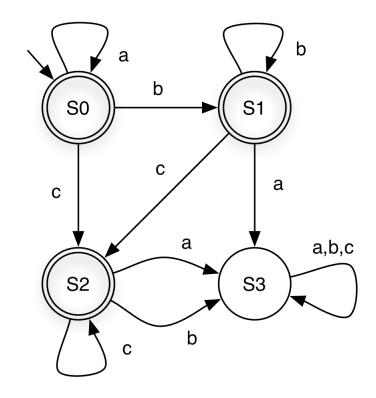

a\*b\*c\*

S3 is a dead state – a nonfinal state with no transition to another state

- aka a trap state

## Finite Automaton: Example 4

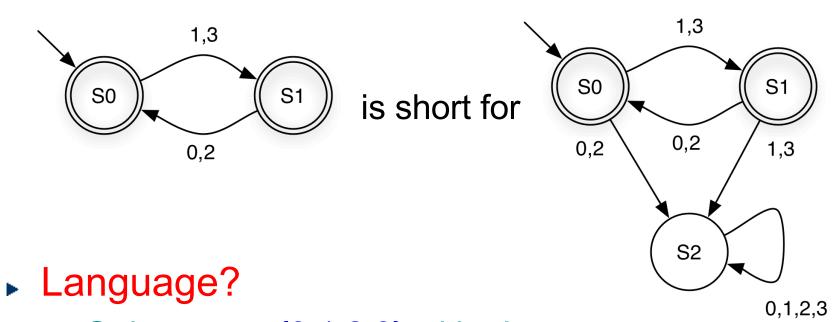

#### Language?

a\*b\*c\* again, so FAs are not unique

CMSC 330 Spring 2020 44

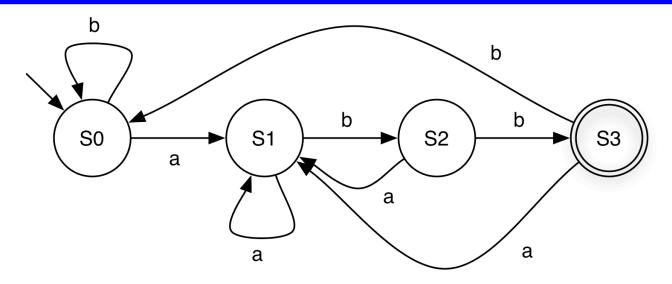

#### **Dead State: Shorthand Notation**

If a transition is omitted, assume it goes to a dead state that is not shown

 Strings over {0,1,2,3} with alternating even and odd digits, beginning with odd digit

#### Finite Automaton: Example 5

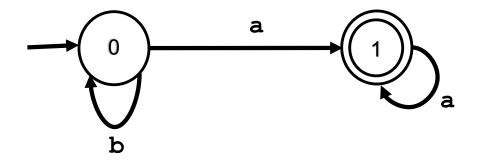

- Description for each state
  - S0 = "Haven't seen anything yet" *OR* "Last symbol seen was a b"
  - S1 = "Last symbol seen was an a"
  - S2 = "Last two symbols seen were ab"
  - S3 = "Last three symbols seen were abb"

## Finite Automaton: Example 5

- Language as a regular expression?
  - ▶ (a|b)\*abb

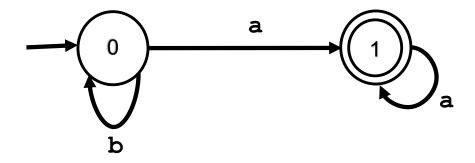

#### Quiz 5

Over  $\Sigma = \{a,b\}$ , this FA accepts only:

- A. A string that contains a single a.
- в. Any string in {a,b}.
- c. A string that starts with b followed by a's.
- D. Zero or more b's, followed by one or more a's.

#### Quiz 5

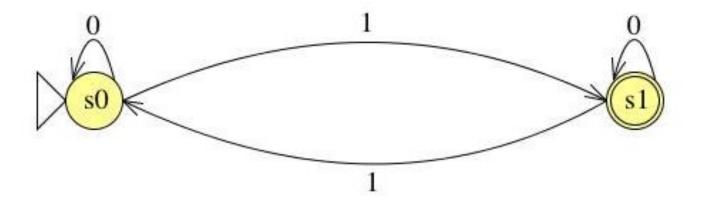

Over  $\Sigma = \{a,b\}$ , this FA accepts only:

- A. A string that contains a single a.
- в. Any string in {a,b}.
- c. A string that starts with b followed by a's.
- D. Zero or more b's, followed by one or more a's.

- That accepts strings containing two consecutive
   0s followed by two consecutive 1s
- That accepts strings with an odd number of 1s
- That accepts strings containing an even number of 0s and any number of 1s
- That accepts strings containing an odd number of 0s and odd number of 1s
- That accepts strings that DO NOT contain odd number of 0s and an odd number of 1s

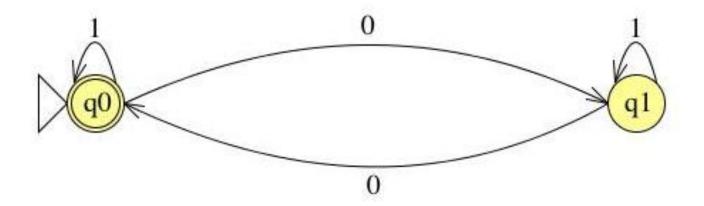

That accepts strings with an odd number of 1s

That accepts strings with an odd number of 1s

 That accepts strings containing an even number of 0s and any number of 1s

That accepts strings containing an even number of 0s and any number of 1s

That accepts strings containing two consecutive
 0s followed by two consecutive 1s

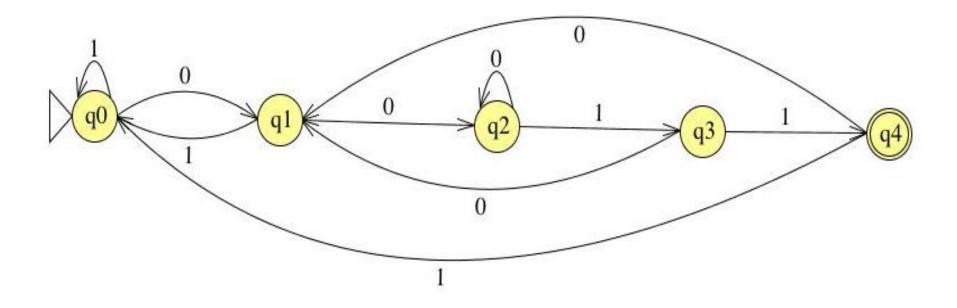

That accepts strings containing two consecutive
 Os very immediately (right after, no other things in between) followed by two consecutive 1s

CMSC 330 Spring 2020 56

That accepts strings end with two consecutive
 Os followed by two consecutive 1s

That accepts strings end with two consecutive
 Os followed by two consecutive 1s

CMSC 330 Spring 2020 58

That accepts strings containing an odd number of 0s and odd number of 1s

That accepts strings containing an odd number of 0s and odd number of 1s

4 states:

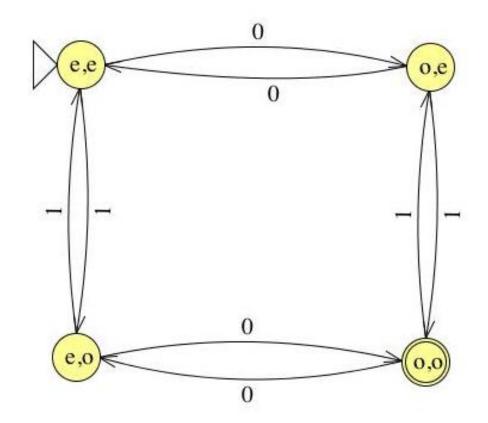

0s 1s

e e

o e

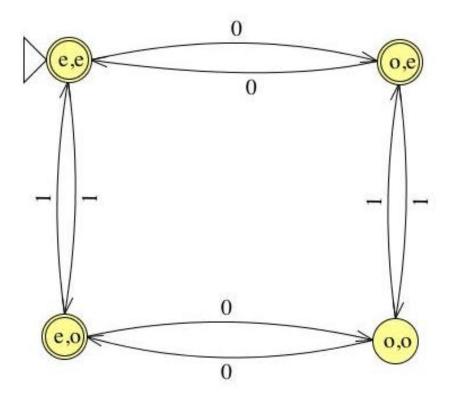

e o

0 0

That accepts strings that DO NOT contain odd number of 0s and an odd number of 1s

That accepts strings that DO NOT contain odd number of 0s and an odd number of 1s

Flip each state
