

# Job Scheduling Under the Portable Batch System

Paper by: Robert L. Henderson

Presented by: Lambros Mertzanis

## Job Scheduling Activities

- Job Selection (Batch)
- Resource Allocation (OS Kernel)

Queue based job selection was the standard.

- FIFO
- Condor
- DQS
- LSF

The Portable Batch System (PBS) can express much more complicated selection policies.

- Job Server
- Resource Monitor
- Machine Oriented Miniserver (MOM)
- Scheduler

# Scheduler

- Run jobs
- Delete jobs
- Suspend jobs
- Reconfigure nodes
- Reconfigure the server

## Resource Monitor

- Physical Memory
- Virtual Memory
- Swap Space
- Load Average
- File System Size

## PBS Policy Interfaces

- BAtch Scheduling Language (BASL)
- Tool Control Language (Tcl)

## Features

- Variables for time, process, server data
- Arithmetic & logical operations
- String concatenation
- Conditional statements and loops

```
foreach host {  
    nrun = 0;  
    if (loadave < 2.0) {  
        foreach job {  
            if (jcput < 60) {  
                run JID HID;  
                nrun += 1;  
            }  
            if (nrune > 2) exit;  
        }  
    }  
}
```

Negligible  
overhead

That's it.
