SPEAKER: Michelle Mazurk
TITLE: Revising what it means to be useable

ABSTRACT:

The usable security community has made significant progress in making security and privacy tools, notifications, and warnings more legible for end users. However, many security and privacy problems remain out of the hands of end users, or – even when simplified – require more knowledge and effort than is reasonable to expect. As such, the next important challenge in usable security is to go beyond end users and explore how to make security and privacy more usable for professionals: software developers and security operations personnel, but also professionals who can influence end users at larger scale. In this talk, I will discuss three studies relevant to this goal: a study of the benefits and challenges of adopting secure
