Definition Let $G \in \mathbb{N}$ and $c \in N$. Let COL: $[G] \times [G] \rightarrow [c]$. 1. A mono *L* is 3 points

$$(x,y),(x+d,y),(x,y+d)$$

that are all the same color $(d \ge 1)$. This is an isosceles L.

2. A mono Square is 4 points

$$(x, y), (x + d, y), (x, y + d), (x + d, y + d)$$

*ロ * * @ * * ミ * ミ * ・ ミ * の < や

that are all the same color $(d \ge 1)$. This is a square.

Theorem There exists *G* such that for all COL: $[G] \times [G] \rightarrow [2]$ there exists a mono square.

Theorem There exists *G* such that for all COL: $[G] \times [G] \rightarrow [2]$ there exists a mono square.

1. The proof of **The Square Theorem** gives enormous bounds on *G*; however, the answer is known to be 15.

Theorem There exists *G* such that for all COL: $[G] \times [G] \rightarrow [2]$ there exists a mono square.

- 1. The proof of **The Square Theorem** gives enormous bounds on *G*; however, the answer is known to be 15.
- 2. We will first prove For all c there exists GG = GG(c) such that for all COL: $[GG] \times [GG] \rightarrow [c]$ there exists a mono L.

Theorem There exists *G* such that for all COL: $[G] \times [G] \rightarrow [2]$ there exists a mono square.

- 1. The proof of **The Square Theorem** gives enormous bounds on *G*; however, the answer is known to be 15.
- 2. We will first prove For all c there exists GG = GG(c) such that for all COL: $[GG] \times [GG] \rightarrow [c]$ there exists a mono L.
- 3. To prove **The Square Theorem** (about 2-coloring) we need to know that GG(c) exists for a very large *c*.

Theorem There exists *G* such that for all COL: $[G] \times [G] \rightarrow [2]$ there exists a mono square.

- 1. The proof of **The Square Theorem** gives enormous bounds on *G*; however, the answer is known to be 15.
- 2. We will first prove For all c there exists GG = GG(c) such that for all COL: $[GG] \times [GG] \rightarrow [c]$ there exists a mono L.
- 3. To prove **The Square Theorem** (about 2-coloring) we need to know that GG(c) exists for a very large *c*.
- More Colors: For all c there exists G = G(c) such that for all COL: [G] × [G] → [c] there exists a mono square. Proof needs a larger c' for GG(c').

Theorem For all *c* there exists GG = GG(c) such that for all $COL: [GG] \times [GG] \rightarrow [c]$ there exists a mono *L*.

▲□▶ ▲□▶ ▲目▶ ▲目▶ | 目 | のへの

Theorem For all *c* there exists GG = GG(c) such that for all $COL: [GG] \times [GG] \rightarrow [c]$ there exists a mono *L*.

Proof We prove this for c = 2. We will set *H* later. Let COL: $[H] \times [H] \rightarrow [c]$.

Theorem For all *c* there exists GG = GG(c) such that for all $COL: [GG] \times [GG] \rightarrow [c]$ there exists a mono *L*.

Proof We prove this for c = 2. We will set *H* later. Let COL: $[H] \times [H] \rightarrow [c]$.

Take the $[H] \times [H]$ grid and tile it with 3×3 tiles. View a 2-coloring of $[H] \times [H]$ as a 2⁹-coloring of the tiles.

Theorem For all *c* there exists GG = GG(c) such that for all $COL: [GG] \times [GG] \rightarrow [c]$ there exists a mono *L*.

Proof We prove this for c = 2. We will set *H* later. Let COL: $[H] \times [H] \rightarrow [c]$.

Take the $[H] \times [H]$ grid and tile it with 3×3 tiles. View a 2-coloring of $[H] \times [H]$ as a 2⁹-coloring of the tiles.

This is very typical of VDW-Ramsey Theory: a 2-coloring of BLAH is viewed as a X-coloring of a different object where X is quite large.

Why This Size Tile?

Any 2-coloring of the 3 \times 3 tile will have two of the same color in the first column and hence an almost L
