

## August 29th: One Page Informal Description of Manson/Pugh model

There is a *happens-before* relation  $\xrightarrow{hb}$  defined on actions  $i \xrightarrow{hb} j$  if  $i$  is before  $j$  in program order, if  $i$  is an unlock or volatile write and  $j$  is a matching lock or volatile read that comes after it in the total order over synchronization actions, or if  $i \xrightarrow{hb} k \xrightarrow{hb} j$  for some  $k$ .

A read  $r$  is *allowed* to see a write  $w$  to the same variable  $v$  if  $r$  does not happen-before  $w$  and if there is no other write  $w'$  to  $v$  such that  $w \xrightarrow{hb} w' \xrightarrow{hb} r$ . An execution that has only allowed reads and respects intra-thread semantics (see Appendix B) is a *happens-before consistent* execution, or hb-consistent for short.

For every execution, there is a total order over actions, consistent with the synchronization order, called the *causal order*. Any read action must see a write that occurs earlier in the causal order. An action  $x$  is *prescient* if there exists an action  $y$  that occurs after  $x$  in the causal order such that  $y \xrightarrow{hb} x$ .

Each prescient action  $x$  in an execution  $E$  must be justified. Let  $\alpha$  be the sequence of actions that precedes  $x$  in the causal order of  $E$ . Let  $J$  be the set of all non-prohibited hb-consistent executions whose causal order consists of  $\alpha$  followed by non-prescient actions (see Appendix C for an algorithm to generate  $J$ ). To prove  $x$  is justified, we need to show that for each  $E'$  in  $J$ :

- an action  $x'$ , congruent to  $x$ , occurs in  $E'$  (either  $x'$  and  $x$  are the same action, or they are both reads of the same variable, and it would be hb-consistent for  $x'$  to see the write seen by  $x$ ), and
- if  $x$  is a write, then for each read action  $y \in E'$  such that  $y$  reads the same variable as  $x'$  and  $y \xrightarrow{hb} x'$ , we need to show  $y \in \alpha$ .

Justification may involve the use of prohibited executions. Prohibited executions are defined by a set of prohibited causal order prefixes  $P$ . Given  $P$ , an execution  $E$  is prohibited if the causal order for  $E$  starts with a prefix in  $P$  (typically,  $P$  is empty and no executions are prohibited).

A set of prohibited prefixes must be valid. To show that a set of prohibited prefixes is valid, we must show that:

- For each prefix  $\alpha x \in P$ , there exists some non-prohibited execution  $E$  with a causal order  $\alpha\beta$  such that  $\beta$  contains no prescient actions.
- Consider any execution  $E$  with causal order  $\alpha xy\beta$  where  $x$  and  $y$  are not conflicting actions and are not both synchronization actions. Also consider the execution  $E'$  with causal order  $\alpha yx\beta$ . Execution  $E$  by be forbidden by  $P$  if and only if  $E'$  is forbidden.

The interpretation of having  $\alpha x$  as a prohibited prefix is that whenever an execution starts with the causal order prefix  $\alpha$ , the action  $x$  is prohibited as the next action in the causal order.

Given these definitions, an hb-consistent execution  $E$  is legal if and only if there exists a set of prohibited prefixes  $P$  such that  $E$  is not prohibited by  $P$  and using  $P$  as the prohibited prefixes, all of the prescient actions in  $E$  are justified.

# Appendix

These appendices include clarifications that have been requested.

## A Differences with Old Model

Here is a brief rundown on the differences between the new model and the model in the community review draft.

- Consistency is now called *hb-consistency*.
- Previously, we allowed a prescient read action to see a write that occurs later in the causal order.  
Now all reads must see writes that occur earlier in the causal order.
- A write  $w$  cannot occur presciently if in the justifying execution there is a conflicting read  $r$  such that  $r \xrightarrow{hb} w$ .
- Prohibited sets are defined in a slightly different way. In particular, they are global, so that in order to justify an action  $x$  in an execution  $E$ , you may not prohibit  $E$ .

## B Intra-thread Semantics

Given an execution where each read sees a write that it is *allowed* to see by the happens-before constraint, we verify that the execution respects intra-thread semantics as follows. For each thread  $t$ , we go through the actions of that thread in program order. For each non-read action  $x$ , we verify that the behavior of that action is what would follow from the previous actions in that thread according to the JLS/JVMS. For a read action, we only verify that the variable read is the one that is determined by the previous actions in the thread according to the JLS; the value seen by the read is determined by the memory model.

## C Generating Non-prescient Extensions

Say we have a program  $P$ , and a partial causal order  $\alpha$ . We can compute the set of all non-prescient extensions to  $\alpha$  as follows.

- Let  $S$  be a set of partial and complete causal orders, initialized to be the singleton set containing  $\alpha$ .
- Let  $W$  be a worklist of causal orders to be explored, initialized to  $S$ .
- While  $W$  is non-empty, choose and remove a causal order  $\beta$  from  $W$

- For each thread  $t$  in  $P$ , select the first statement in program order whose execution is not in  $\beta$ .
  - \* If that statement is not a read, then evaluate that statement in the thread-local context of  $\beta$ , generating action  $x$ , and add  $\beta x$  to both  $S$  and  $W$ .
  - \* If that statement is a read, determine, in the thread-local context of  $\beta$ , which variable  $v$  will be read. For each write  $w \in \beta$  of  $v$  that could be seen by the read, generate the action  $r$  corresponding to that read seeing  $w$ , and add  $\beta r$  to both  $S$  and  $W$ .
- When  $W$  is empty, the complete causal orders in  $S$  corresponding to hb-consistent executions are the non-prescient extensions to  $\alpha$ .
