

CMSC427

Parametric surfaces  
and polygonal meshes

- These slides are incomplete
- See accompanying PDF with detailed outline
- Will develop many equations in class
- Reading later to supplement

# Moving to 3D

- Polygonal meshes
  - Set of standard shapes in Blender

- And how to create them
  - And store them
  - And draw them

lathe  
⇒

render  
⇒

# Bilinear patch

- Blending of four 3D points
- Ruled surface
  - Swept out by sequence of lines

# Bilinear patch

- Blend simultaneously along two lines
- $P_{01} = t(P_1 - P_0) + P_0$
- $P_{23} = t(P_2 - P_3) + P_3$
- Same  $t$  in  $[0,1]$

# Bilinear patch

- Blend simultaneously along two lines

- $P_{01} = tP_1 + (1-t)P_0$

- $P_{23} = tP_3 + (1-t)P_2$

- Same  $t$  in  $[0,1]$

- Then blend between the two lines

- $P = sP_{23} + (1-s)P_{01}$

- $P = s(tP_1 + (1-t)P_0) + (1-s)(tP_3 + (1-t)P_2)$

# Bilinear patch

- Questions

- What order polynomial?
- Convex combination?
- What is drawn if  $t$  is constant?
- What is drawn if  $s$  is constant?

- $$P = s(tP_1 + (1-t)P_0) + (1-s)(tP_3 + (1-t)P_2)$$

# Bilinear patch

- Questions

- What order polynomial?
- Convex combination?
- What is drawn if  $t$  is constant?
- What is drawn if  $s$  is constant?

- $P = s(tP_1 + (1-t)P_0) + (1-s)(tP_3 + (1-t)P_2)$
- $P = stP_1 + s(1-t)P_0 + (1-s)tP_3 + (1-s)(1-t)P_2$

# Coons patch

- What's happening in this surface?

# Coons patch

- What's happening in this surface?

- Blending two arcs
  - Is this a ruled surface?

# Coons patch

- Blend four arbitrary curves
- Here  $C_1$ ,  $C_2$ ,  $D_1$ ,  $D_2$

# Circle with trig: review

Parametric equation

$$x = R \cos(t)$$

$$y = R \sin(t)$$

$$0 \leq t \leq ??$$

# Parametric cone

# Parametric cylinder

# Rendering faces: need location and normal

- Need distance and orientation relative to lights to compute reflected light

# Polygonal mesh

- Simplest mesh: tetrahedron
- Indexed mesh representation
  - Vertex list
  - Normal list
  - Face list

a)

b)

numVerts	4	0	1	0	0
pt		0	0	1	0
		0	0	0	1
numNorms	4	.577	0	-1	0
norm		.577	0	0	-1
		.577	-1	0	0
numFaces	4	3	3	3	3
face		1	0	2	3

		3	3	3	3

- Non-indexed representation
  - List of faces with repeated vertices

# Polygonal mesh

- Hill's barn
- 10 vertices
- 7 faces
- 7 normals

# Polygonal mesh

- Hill's barn
- 10 vertices
- 7 faces
- 7 normals
- Solution for one face:
  - Face vertices (CCW):
    - 5 6 7 8 9
  - Face normals:
    - 5 5 5 5 5
- Alternative: triangulate
  - Face1: 5 6 7, Face2: 5 7 9, Face 3: 7 8 9

# Drawing mesh

- Draw as points: iterate through points
- Draw as lines: iterate through adj. pts. in faces
  - Problem?
  - Alternative: add edge list to structure
  - Alternative: better link faces to avoid redundancy
- Draw as "solid": iterate through faces

# File formats

- STL
  - [https://en.wikipedia.org/wiki/STL \(file format\)](https://en.wikipedia.org/wiki/STL_(file_format))
- OBJ
  - [https://en.wikipedia.org/wiki/Wavefront .obj file](https://en.wikipedia.org/wiki/Wavefront_.obj_file)
- Many others
- Not hard to generate your own STL files

- Free viewing software: Meshlab
  - (<http://www.meshlab.net>)
  - Good for viewing, repairing, decimating meshes
- Sources of 3D mesh models:
  - SketchFab (<https://sketchfab.com>)
  - Thingiverse (<https://www.thingiverse.com>)
  - Stanford repository  
(<http://graphics.stanford.edu/data/3Dscanrep/>)
- Std Examples: Utah teapot, Stanford bunny

# Generating polygonal mesh from parametric surface

- Step 1:
- Sources of 3D mesh models:
  - SketchFab (<https://sketchfab.com>)
  - Thingiverse (<https://www.thingiverse.com>)
  - Stanford repository  
(<http://graphics.stanford.edu/data/3Dscanrep/>)
- Std Examples: Utah teapot, Stanford bunny

# Topological properties of meshes

- Is a mesh well connected?
- Any flaws?
- More later

# Generating mesh from parametric surface

- Given parametric surface
  - $P(u,v) = \langle x(u,v), y(u,v), z(u,v) \rangle$
- Generate mesh
- Steps:
  - 1. Set # divisions in  $u,v$  as  $n, m$
  - 2. Generate  $u,v$  in for loops
  - 3. Store in 2D array of 3D points
  - 4. From array generate faces

# Computing normal vectors for mesh

- Approach 1: Cross product of numeric data
  - Find  $v_1$  and  $v_2$  from vertices (which?)
  - $N = v_1 \times v_2$
  - Less arbitrary: Newell's method
- Approach 2: Partial derivatives of parametric curve
  - Given vector  $P(u,v) = \langle x(u,v), y(u,v), z(u,v) \rangle$
  - Derive vectors  $dU = dP(u,v)/du$  and  $dV = dP(u,v)/dv$
  - $N = dU \times dV$
- Approach 3: Gradient vector of implicit surface
  - Given implicit function  $f(x,y,z)$
  - Derive gradient  $\langle df/dx, df/dy, df/dz \rangle$

# Creating polygonal meshes: summary

- Fixed shapes.
  - Any shape based on idiosyncratic data, such as the exact shape of a stone, foot, sculpture, etc. All hard-coded, some from real world data collection
- Regular polyhedron
  - Cubes, tetrahedrons, icosahedrons, dodecahedrons, ...
- Operations that create shapes
  - Extrusion
  - Lathing (surfaces of rotation)
  - Surface subdivision
- Parametric shapes (related to operations)
  - Bilinear patches, quadrics, superellipses, etc.
