

How Do Computers Solve Geometric Problems?

Sorelle Friedler, University of Maryland - College Park
<http://www.cs.umd.edu/~sorelle>

Outline

- ▶ **Introduction**
 - ▶ Algorithms
 - ▶ Computational Geometry
- ▶ **Art Museum Problem**
- ▶ **The Cheapest Place to Find a Cheeseburger**

Algorithms

What is an algorithm?

- ▶ A sequence of precise instructions
- ▶ Followed to reliably solve a problem
 - ▶ Proof needed
- ▶ Represent computer programs

Computational Geometry

Study of geometry using computers and for computers

- ▶ **Examples**

- ▶ Line segment intersections
- ▶ Moving point collisions
- ▶ Point clustering

- ▶ **Applications**

- ▶ GPS systems
- ▶ Navigation
- ▶ Animation
- ▶ Cell phone service

Art Museum Problem

Protect the art with the minimum number of cameras

- ▶ Gallery represented by a simple polygon
- ▶ Polygon has n sides
- ▶ Cameras and art can be placed anywhere
- ▶ How many cameras are needed to view the whole area? (as a function of n)

Art Museum Problem

How many cameras are necessary?

- ▶ Only one camera needed for any convex polygon
- ▶ Convex: All diagonals are internal

- ▶ Concave: Not convex

Art Museum Problem

How many cameras are necessary?

- ▶ For any polygon with n sides

sides	cameras
3	1
4	1
5	1
6	2

- ▶ Look at polygons with 3-6 sides
- ▶ Remember concave polygons

Art Museum Problem

What is the function $c(n)$ for the number of cameras?

- ▶ For any polygon with n sides

sides	cameras
3	1
4	1
5	1
6	2

- ▶ $\lfloor x \rfloor$ rounds x down to the nearest integer

$$c(n) = \left\lfloor \frac{n}{3} \right\rfloor$$

- ▶ This shows $c(n)$ cameras are necessary
- ▶ Will show $c(n)$ cameras are sufficient

Art Museum Problem

How can we determine where to place the cameras?

- ▶ 10-sided polygon
- ▶ 3 cameras allowed
 - ▶ Only one needed
- ▶ What do you think?
 - ▶ When is it easy to place one camera?

Art Museum Problem: Triangulation

What is a triangulation of a polygon?

- ▶ A partition of a polygon into triangles
- ▶ Add internal diagonals between vertices until no more can be added without crossing others
- ▶ There can be multiple ways to triangulate a polygon

Art Museum Problem: Triangulation

How can we divide a polygon into triangular regions?

Algorithm:

- ▶ Consider all diagonals
- ▶ Until no more diagonals can be inserted
 - ▶ Choose a diagonal that is
 1. Internal
 2. Does not cross any previously chosen diagonals
- ▶ Chosen diagonals give triangulation

Art Museum Problem

How can we automate camera placement?

- ▶ **Algorithm**

- ▶ Triangulate the polygon
- ▶ 3-color the vertices
 - ▶ No color can share an edge with itself
- ▶ Choose the color that appeared least
 - ▶ No more than $n/3$ of that color
- ▶ Put a camera on every vertex that color

Outline

- ▶ **Introduction**
 - ▶ Algorithms
 - ▶ Computational Geometry

Voronoi Diagrams: Numb3rs clip

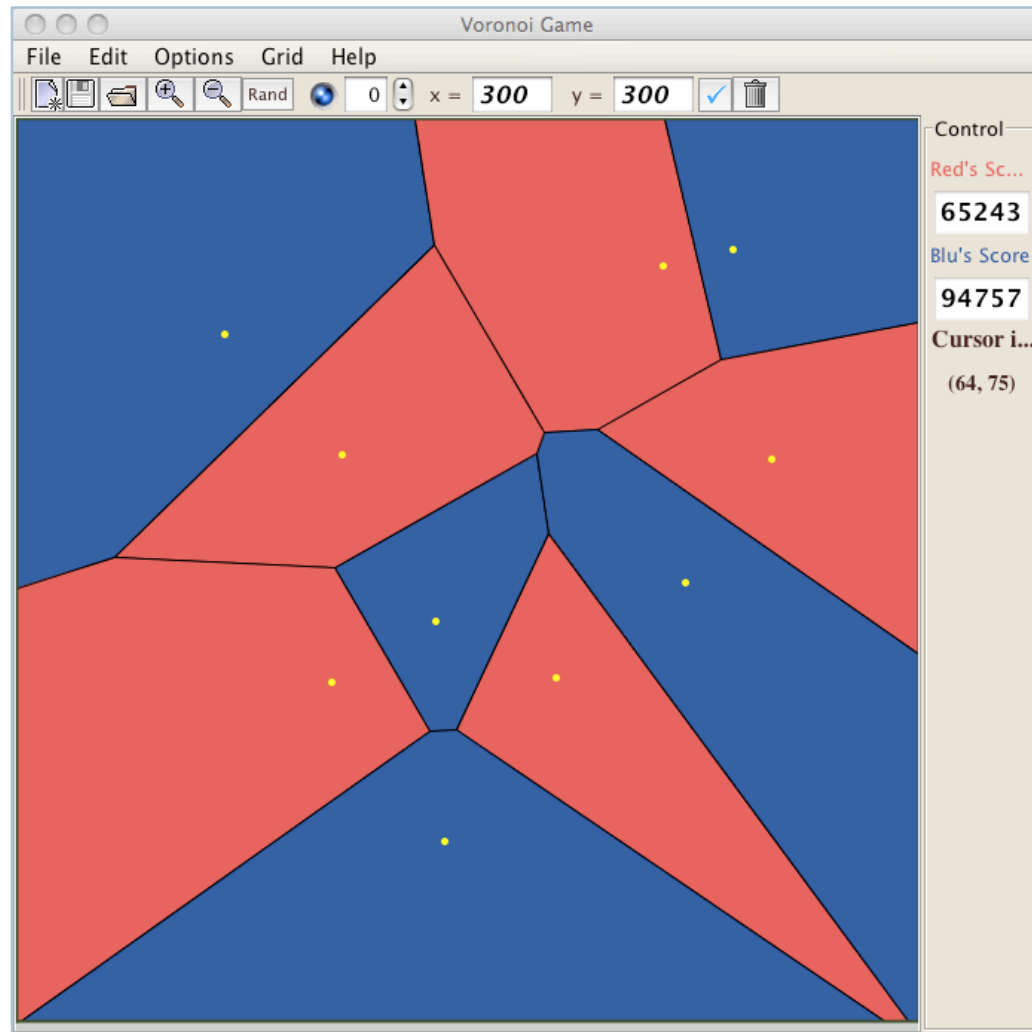

Voronoi Diagrams

Which site is closest to a given point?

- ▶ Divide space into regions in which all points are closer to the site representing the region than to any other site.
- ▶ Applications:
 - ▶ Cell phone towers
 - ▶ Fire station regions
 - ▶ Laziness

Voronoi Diagrams

Voronoi Diagrams

Circle property

- ▶ Center a circle at the intersection of 3 region boundaries
- ▶ 3 sites on its perimeter
- ▶ No sites in its interior

Voronoi Diagrams: Delaunay Triangulations

**Dual version of Voronoi diagrams:
Create edges between adjoining cells' sites**

Voronoi Diagrams

How can we determine the Voronoi diagram?

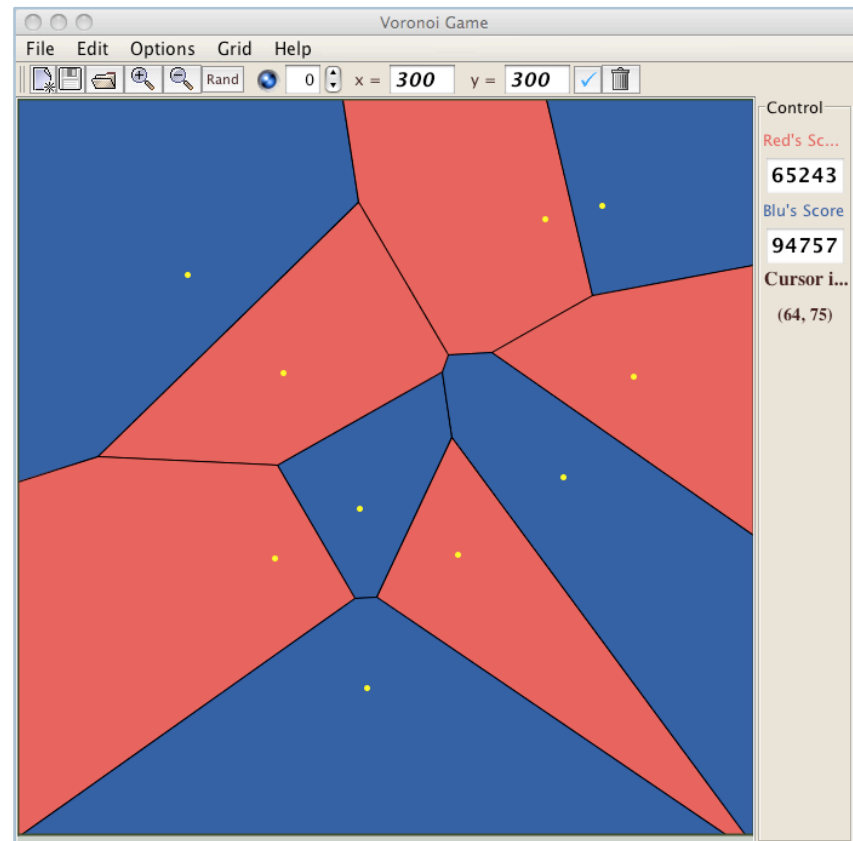

- ▶ Given n sites (points)
- ▶ Let each site grow cones at the same rate
- ▶ Cones are at 45° angles
- ▶ The flattened/projected view of the cones is the Voronoi diagram

Voronoi Game

Try to serve the largest area

- ▶ Players alternate turns
- ▶ Each player gets a set number of sites to place
- ▶ Each turn for each player
 - ▶ The player places a site
 - ▶ The area is divided into Voronoi regions
- ▶ Player with the greatest area wins

Voronoi Game

One-dimensional version

- ▶ **Goal: Control the most items (green crosses)**
- ▶ **Rules:**
 - ▶ Players alternate turns
 - ▶ Each player gets a set number of sites to place
 - ▶ On each turn, each player places a site on an integral location
 - ▶ Player with some site closest to the most items wins
 - ▶ Equally close sites are awarded to no-one

Voronoi Game

What's the best strategy?

- ▶ Play the game, changing the number of sites that you each place and who goes first or second.
- ▶ If you have to go second, how many sites do you want to be able to place?
 - ▶ 1 or 7 guarantee that you lose. Why?
 - ▶ Can you guarantee a tie or a win for a 2 site game if you get to go first? What if you have to go second?

Voronoi Game

2 round, one-dimensional version

- ▶ Control of both 4 and 10 wins the game
- ▶ The second player playing symmetrically guarantees a tie
- ▶ The first player can not guarantee a win

Asymptotic Notation

If the input size is n , how long does the algorithm take?

► $O(n)$

time

n

► $O(n^2)$

time

n
