

CMSC 634

Project 1

Due: start of class on October 14th.

Work in pairs.

Conduct an experiment that would be of interest to human-computer interaction researchers. Be sure to choose independent and dependent variables that can easily be approximated by numerical measurements. Identify the population of the experiment and describe how you selected a sample. Analyze your data using quantitative statistics and use that analysis to make conclusions.

Write a report in the standard ACM 2-column format and include all sections necessary in a research paper.
