Course Overview: This course presents an introduction to the techniques for designing efficient computer algorithms and analyzing their running times. General topics include asymptotics, solving summations and recurrences, algorithm design techniques, analysis of data structures, and introduction to NP-completeness.

Prerequisites: Each student is expected to know the basic concepts of programming (e.g. loops, pointers, recursion), discrete mathematics (proof by induction, sets), simple data structures (lists, stacks, queues, trees), and calculus (logarithms, differentiation, integration).

Course Work: Course work will consist of written homework assignments, and two exams (a midterm and a final). You may discuss homework problems and general solution strategies with classmates, but you must write up the solutions yourself.

As a courtesy to the grader, homeworks are to be written clearly and neatly. Poorly written work will not be graded. When writing algorithms be sure not only that your solution is correct, but also that it is easy for the grader to understand why your solution is correct. Part of your grade will be based not only on correctness, but also on the simplicity, clarity, and elegance of your solutions.

Exams: The midterm exam will be on Wednesday, April 2 from 6:00pm–8:00pm. The final exam will be on Saturday, May 17 from 4:00pm–6:00pm. If either of the exam times do not work for you, let the instructor know now.

Piazza: We will be using Piazza (www.piazza.com), a question-and-answer system designed to streamline discussion outside of the classroom. It supports LaTeX, code formatting, embedding of images, and attaching of files. It will be moderated by the instructors and TAs, but students are encouraged to answer questions.

Grading: Final grades will be based on the written assignments, a midterm exam, and a final exam. The relative weights of these will be 10% for the homework total, 40% for the midterm, and 50% for the final exam.
Laptops: Laptops and similar devices may not be used during class, except to take notes, in which case the notes must be shared with the instructor.

Syllabus: This is the current version of the syllabus. The instructor reserves the right to change it at any time.

Topics: The following is a tentative list of topics and readings in approximate order.

1. Introduction, Ch. 1,2
2. Quadratic Sorting Algorithms, Ch. 2
3. Summations, Appendix A
4. Merge Sort, Ch. 2
5. Growth of Functions, Ch. 3
6. Recurrences (Integer Multiplication) Ch. 4
7. Heapsort, Ch. 6
8. Quicksort, Ch. 7
9. Sorting in Linear Time, Ch. 8
10. Medians and Order Statistics, Ch. 9
11. Graphs and Trees, Appendix B
12. Dijkstra’s algorithm, Ch. 24.3
13. Brief introduction to NP-completeness, Ch. 34
