

CMSC433, Spring 2001 Programming Language Technology and Paradigms Java RMI

Alan Sussman
October 25, 2001

Administrivia

- Read Chapter 15, pages 973-979, on RMI
- Project 3 due tomorrow
- Project 2 grades out, but will need some regrading
- Project 4 due November 7
 - distributed chat server, using RMI
 - posted by tomorrow, central server running soon

CMCS 433, Fall 2001 - Alan Sussman

2

Last time

- Multithreaded programming
 - and the Java memory model
 - Motto is: Be careful!

CMCS 433, Fall 2001 - Alan Sussman

3

Different Approaches to Distributed Computation

- High-performance, parallel scientific apps
- Connecting via sockets
 - custom protocols for each application
- RPC/DCOM/CORBA/RMI
 - make what looks like a normal function call
 - function is actually invoked on another machine
 - Arguments are *marshalled* for transport
 - return value is marshalled as well

CMCS 433, Fall 2001 - Alan Sussman

4

Remote Method Invocation

- Easy way to get distributed computation
- Have stub for remote object
 - calls to stub get translated into network call
- Arguments and return values can be passed over network

CMCS 433, Fall 2001 - Alan Sussman

5

Remote Objects and Interfaces

- Remote Objects are those that can be referenced remotely
 - extend **java.rmi.UnicastRemoteObject**
 - constructor throws **java.rmi.RemoteException**
- Remote interfaces describe services that can be provided remotely
 - extend **java.rmi.Remote** interface
 - all methods throw **java.rmi.RemoteException**

CMCS 433, Fall 2001 - Alan Sussman

6

RMIC - RMI Compiler

- Generates stub code for a class
 - For 1.1, also generates skeleton class
 - skeleton not needed for 1.2+
- Generates stubs for all methods declared in remote interfaces
 - other methods don't get a stub

CMCS 433, Fall 2001 - Alan Sussman

7

Passing arguments

- Can pass arbitrary values as arguments
- Can return arbitrary values as results
- To pass a value, it must either be
 - **Serializable**, or
 - **Remote**
- Passing the same Serializable object in different calls
 - will materialize different objects at receiver

CMCS 433, Fall 2001 - Alan Sussman

8

Downloading code

- When you pass a reference to a remote class
 - receiver (the method being called) needs stub class code (class file generated by *rmic*)
- When you pass a ref to serializable class
 - receiver needs class (the class file from *javac*)
- References to remote and serializable classes annotated with *RMI codebase*
 - where code can be loaded from

CMCS 433, Fall 2001 - Alan Sussman

9

SecurityManager

- Must install some Security Manager to allow download of classes from RMI codebase
- Can use **RMISecurityManager**
System.setSecurityManager(new RMISecurityManager());
- Modify policy file to grant permissions
 - example of that on Lectures web page

CMCS 433, Fall 2001 - Alan Sussman

10

Naming.lookup

- Naming.lookup is used to bootstrap RMI communication
 - Get your first reference to a remote object
- Someone runs an RMIRegistry
 - a separate Java VM (or can run inside a JVM also running something else)
 - that listens to a particular port (default 1099)
- Can bind/unbind/rebind name on localhost (the one running the registry)
- Can lookup name on any host

CMCS 433, Fall 2001 - Alan Sussman

11

RMI Chat server example

- Server
 - runs the chat room
- Client
 - participant in chat room
 - receives messages from others in room
- Connection
 - uniquely identifies a client
 - used to speak in chat room

CMCS 433, Fall 2001 - Alan Sussman

12

Server

```
interface Server extends Remote {
    Connection logon(String name, Client c)
        throws RemoteException;
}
```

CMCS 433, Fall 2001 - Alan Sussman

13

Connection

```
interface Connection extends Remote {
    /** Say to everyone */
    void say(String msg)
        throws RemoteException;
    /** Say to one person */
    void say(String who, String msg)
        throws RemoteException;
    String [] who()
        throws RemoteException;
    void logoff()
        throws RemoteException;
}
```

CMCS 433, Fall 2001 - Alan Sussman

14

Client

```
interface Client extends Remote {
    void said(String who, String msg)
        throws RemoteException;
    void whoChanged(String [] who)
        throws RemoteException;
}
```

CMCS 433, Fall 2001 - Alan Sussman

15

Remote Object creation on Server host

Server s = new ServerImpl();

CMCS 433, Fall 2001 - Alan Sussman

16

RMI Registry on Server host

Naming.rebind("ChatServer", s);

RMIRegistry

CMCS 433, Fall 2001 - Alan Sussman

17

Client creation on Client host

Client c = new ClientImpl();

CMCS 433, Fall 2001 - Alan Sussman

18
