

# Edge Detection

Mohammad Nayeem Teli

# Origin of Edges

Edges are caused by a variety of factors

# Edge detection (1D)

Edge= sharp variation

Large first derivative

# Edge is Where Change Occurs

Change is measured by derivative in 1D

Biggest change, derivative has maximum magnitude

Or 2<sup>nd</sup> derivative is zero.

# Image gradient

The gradient of an image:

$$\nabla f = \left[ \frac{\partial f}{\partial x}, \frac{\partial f}{\partial y} \right]$$

The gradient points in the direction of most rapid change in intensity

The gradient direction is given by:

$$\theta = \tan^{-1} \left( \frac{\partial f / \partial y}{\partial f / \partial x} \right)$$

- How does this relate to the direction of the edge?

The *edge strength* is given by the gradient magnitude

$$\|\nabla f\| = \sqrt{\left(\frac{\partial f}{\partial x}\right)^2 + \left(\frac{\partial f}{\partial y}\right)^2}$$

# The discrete gradient

How can we differentiate a *digital* image  $f[x,y]$ ?

- ◆ Option 1: reconstruct a continuous image, then take gradient
- ◆ Option 2: take discrete derivative (finite difference)

$$\frac{\partial f}{\partial x}(x, y) = \frac{f(x + 1, y) - f(x - 1, y)}{2}$$

How would you implement this as a cross-correlation?

# The Sobel operator

Better approximations of the derivatives exist

- ◆ The *Sobel* operators below are very commonly used

$$\frac{1}{8} \begin{array}{|c|c|c|} \hline -1 & 0 & 1 \\ \hline -2 & 0 & 2 \\ \hline -1 & 0 & 1 \\ \hline \end{array}$$

$s_x$

$$\frac{1}{8} \begin{array}{|c|c|c|} \hline 1 & 2 & 1 \\ \hline 0 & 0 & 0 \\ \hline -1 & -2 & -1 \\ \hline \end{array}$$

$s_y$

- The standard defn. of the Sobel operator omits the  $1/8$  term
  - doesn't make a difference for edge detection
  - the  $1/8$  term **is** needed to get the right gradient value, however

# Fourier domain

# Fourier domain

Spatial domain

Frequency domain

# Fourier

- How do we represent points in 2D?
- We write any point as a linear combination of two vectors  $(1,0)$  and  $(0,1)$

$$(x,y) = x(1,0) + y(0,1)$$

- Suppose our basis vectors were  $(1,0)$  and  $(1,1)$

$$(x,y) = u(1,0) + v(1,1)$$

- Point  $(7,3)$  would be represented as  $4(1,0) + 3(1,1)$ .

# Fourier

- Fourier provides orthonormal basis for images.
- Think of images as a continuous function (a periodic function)
- The following functions provide an orthonormal basis for functions:

$$\frac{1}{\sqrt{2\pi}}, \frac{\cos(kx)}{\sqrt{\pi}}, \frac{\sin(kx)}{\sqrt{\pi}} \text{ for } k = 1, 2, 3, \dots$$

- These functions form the Fourier series.

# Fourier

- To define whether a set of functions are orthonormal , we need to define an inner product between two functions.
- We do it similar to discrete functions.
- Multiply them together, integrate the result.
- Inner product between two functions  $f(x)$  and  $g(x)$

$$\langle f, g \rangle = \int_0^{2\pi} f(x)g(x)$$

# Fourier

- When we say two functions are orthogonal we mean  $\langle f, g \rangle = 0$
- Functions in the Fourier series have unit magnitude.
- Any function can be expressed as a linear combination of the elements of the Fourier series

$$f(x) = a_0 \frac{1}{\sqrt{2\pi}} + \sum_{k=1}^{\infty} \left( b_k \frac{\cos(kx)}{\sqrt{\pi}} + a_k \frac{\sin(kx)}{\sqrt{\pi}} \right)$$

The values  $a_0, b_1, a_1, b_2, \dots$  are coordinates

# Fourier

Pythagorean analog in Fourier is called Parseval's theorem

$$\int_0^{2\pi} f^2(x) dx = a_0^2 + \sum_1^{\infty} (a_i^2 + b_i^2)$$

# Effects of noise

Consider a single row or column of the image

- Plotting intensity as a function of position gives a signal

Where is the edge?

# Solution: smooth first

Where is the edge? Look for peaks  $\frac{\partial}{\partial x}(h * f)$

# Convolution Theorem

- ◆ The *Fourier transform* of the convolution of two functions is the product of their Fourier transforms

$$F[g * h] = F[g]F[h]$$

- ◆ The inverse Fourier transform of the product of two Fourier transforms is the convolution of the two inverse Fourier transforms

$$F^{-1}[g * h] = F^{-1}[g]F^{-1}[h]$$

- ◆ Convolution in spatial domain is equivalent to multiplication in frequency domain.

# Derivative theorem of convolution

$$\frac{\partial}{\partial x}(h \star f) = \left(\frac{\partial}{\partial x}h\right) \star f$$

This saves us one operation:

# Derivative of Gaussian filter

---

$$* [1 \ -1] =$$

Is this filter separable?

# Derivative of Gaussian filter

---

x-direction

y-direction

Which one finds horizontal/vertical edges?

# Laplacian of Gaussian

Consider  $\frac{\partial^2}{\partial x^2}(h \star f)$

$f$

$\frac{\partial^2}{\partial x^2}h$

$(\frac{\partial^2}{\partial x^2}h) \star f$

Where is the edge? Zero-crossings of bottom graph

# 2D edge detection filters

Gaussian

$$h_{\sigma}(u, v) = \frac{1}{2\pi\sigma^2} e^{-\frac{u^2+v^2}{2\sigma^2}}$$

derivative of Gaussian

$$\frac{\partial}{\partial x} h_{\sigma}(u, v)$$

Laplacian of Gaussian

$$\nabla^2 h_{\sigma}(u, v)$$

$\nabla^2$  is the **Laplacian** operator:

$$\nabla^2 f = \frac{\partial^2 f}{\partial u^2} + \frac{\partial^2 f}{\partial v^2}$$

# Tradeoff between smoothing and localization

---

1 pixel

3 pixels

7 pixels

Smoothed derivative removes noise, but blurs edge. Also finds edges at different “scales”.

# Implementation issues

---

- The gradient magnitude is large along a thick “trail” or “ridge,” so how do we identify the actual edge points?
- How do we link the edge points to form curves?
