CMSC436: Programming Handheld Systems

Location & Maps

Today's Topics

Location

Location support classes

Maps

Map support classes

Location Services

Mobile applications can benefit from being location-aware

Allows applications to determine their location and modify their behavior

Using Location Information

Find stores near the user's current location

Direct a user from a current to a particular store

Define a geofence

Initiate action when user enters or exits the geofence

Location Architecture

Location

LocationProvider

LocationManager

LocationListener

Location

Represents a position on the Earth

A Location instance consists of:

Latitude, longitude, timestamp and, optionally, accuracy, altitude, speed, and bearing

LocationProvider

Represents a location data source

Actual data may come from

GPS satellites

Cell phone towers

WiFi access points

LocationProvider Types

Network – WiFi and cell tower

GPS - Satellite

Passive – Piggyback on the readings requested by other applications

NetworkProvider

Determines location based on cell tower and WiFi access points

Requires either

android.permission.ACCESS_COARSE_LOCATION

android.permission.ACCESS_FINE_LOCATION

GPSProvider

Determines location using satellites

Requires

android.permission.ACCESS_FINE_LOCATION

PassiveProvider

Returns locations generated by other providers

Requires

android.permission.ACCESS_FINE_LOCATION

LocationProvider

Different LocationProviders offer different tradeoffs between cost, accuracy, availability & timeliness

LocationProvider Tradeoffs

GPS – expensive, accurate, slower, available outdoors

Network - cheaper, less accurate, faster, availability varies

Passive – cheapest, fastest, not always available

LocationManager

System service for accessing location data

getSystemService(Context.LOCATION_SERVICE)

LocationManager

Determine the last known user location

Register for location updates

Register to receive Intents when the device nears or moves away from a given geographic area

LocationListener

Defines callback methods that are called when Location or LocationProvider status changes

LocationListener

void onLocationChanged (Location location)

void onProviderDisabled (String provider)

void onProviderEnabled (String provider)

void onStatusChanged (String provider,
                                       int status,
                                       Bundle extras)

Obtaining and Using Location Information

Start listening for updates from LocationProviders

Maintain a "current best estimate" of location

When estimate is "good enough", stop listening for location updates

Use best location estimate

Determining Best Location

Several factors to consider
- Measurement time

- Accuracy

- Power usage

LocationGetLocation

Application acquires and displays the last known locations from all providers

If necessary, acquires and displays new readings from all providers

Location
Get Location

LocationGetLocation

No Initial Reading Available
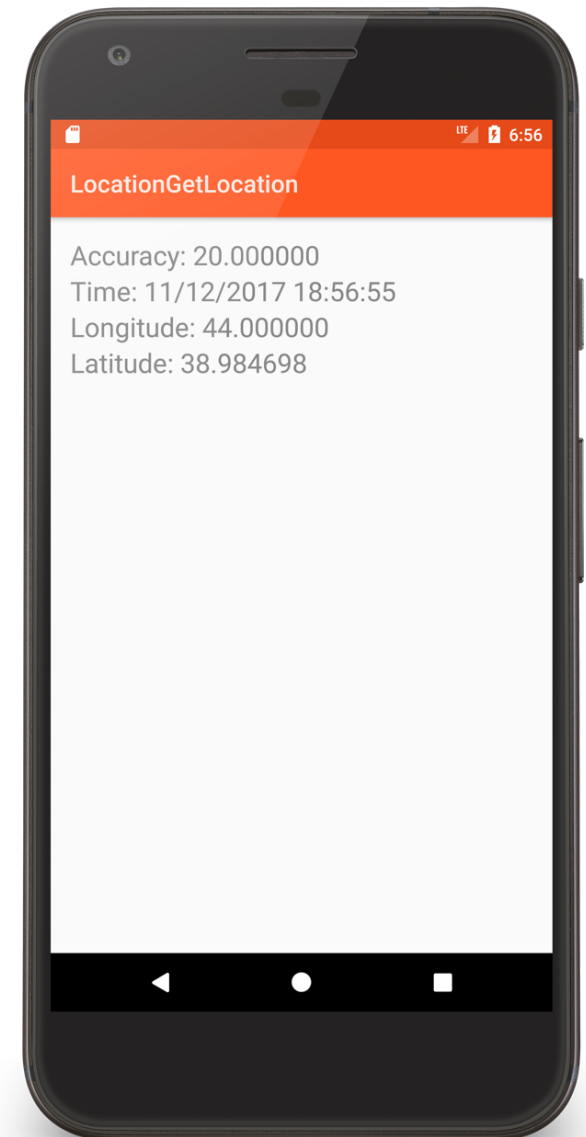

LocationGetLocationServices

The same as LocationGetLocation, but uses newer FusedLocationProvider class

Uses Google Play Services

Battery Saving Tips

Always check last known measurement

Return updates as infrequently as possible

Limit measurement time

Use the least accurate measurement necessary

Turn off updates in onPause()

Maps

A visual representation of area

Android provides Mapping support through the Google Maps Android v2 API

Map Types

Normal: traditional road map

Satellite – Aerial photograph

Hybrid - Satellite + road map

Terrain - Topographic details

Customizing the Map

Change the camera position

Add Markers & ground overlays

Respond to gestures

Indicate the user's current Location

Some Map Classes

GoogleMap

MapFragment

Camera

Marker

Setting up a Maps Application

Set up the Google Play services SDK

Obtain an API key

Specify settings in Application Manifest

Add map to project

See: https://developers.google.com/maps
/documentation/android/start

Map Permissions

```
<uses-permission android:name=
                 "android.permission.INTERNET"/>

<uses-permission android:name=
      "android.permission.ACCESS_NETWORK_STATE"/>
```

Map Permissions

```
<uses-permission android:name=
   "android.permission.WRITE_EXTERNAL_STORAGE"/>

<uses-permission android:name=
      "com.google.android.providers.
               gsf.permission.READ_GSERVICES"/>
```

Map Permissions

```
<uses-permission android:name=
    "android.permission.ACCESS_COARSE_LOCATION"/>

<uses-permission android:name=
    "android.permission.ACCESS_FINE_LOCATION"/>
```
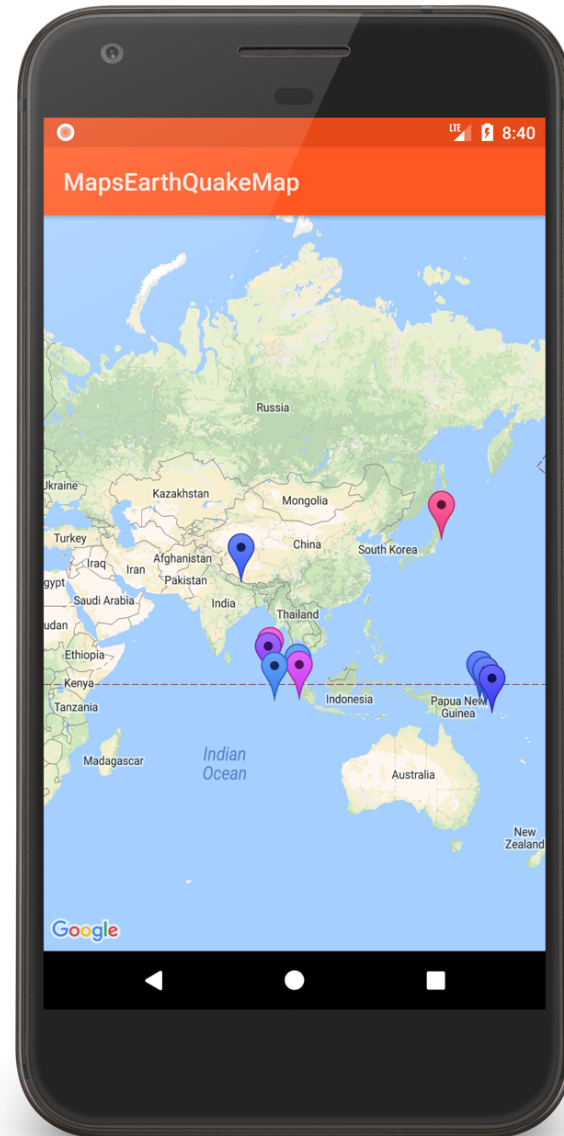

MapEarthQuakeMap

This application acquires earthquake data from a server

Then it displays the data on a map, using clickable markers

MapEarth
QuakeMap

MapsEarthquakeMapActivity.kt

```kotlin
// Set up UI and get earthquake data
public override fun onCreate(savedInstanceState: Bundle?) {
…
// The GoogleMap instance underlying the GoogleMapFragment defined
// in main.xml
 val map = supportFragmentManager.findFragmentById(R.id.map)
                                        as SupportMapFragment?

    map?.getMapAsync(this)
}
```

MapsEarthquakeMapActivity.kt

```kotlin
// Called when Map is ready
override fun onMapReady(googleMap: GoogleMap) {
    mMapReady = true
    mMap = googleMap
    mMap!!.moveCamera(CameraUpdateFactory.newLatLng(
                            LatLng(CAMERA_LAT,CAMERA_LNG)))

    if (mDataReady) {
        placeMarkers()
        mMapReady = false
    }
}
```

MapsEarthquakeMapActivity.kt

```kotlin
// Called when data is downloaded
override fun onDownloadfinished() {
    mDataReady = true
    if (mMapReady) {
        placeMarkers()
        mDataReady = false
    }
}
```

MapsEarthquakeMapActivity.kt

```kotlin
private fun placeMarkers() { // Add a marker for every earthquake
    for (rec in mRetainedFragment?.data!!) {
        // Add a new marker for this earthquake
        mMap!!.addMarker(MarkerOptions()
        // Set the Marker's position
                .position(LatLng(rec.lat,rec.lng))
        // Set the title of the Marker's information window
                .title(rec.magnitude.toString())
                // Set the color for the Marker
                .icon(BitmapDescriptorFactory.defaultMarker(
                        getMarkerColor(rec.magnitude))))
    }
}
```
