

CMSC436: Programming Handheld Systems

Multi-Touch & Gestures

Today's Topics

MotionEvent

Touch Handling

Gestures

MotionEvent

Represents a movement in an input device reading
pen, trackball, mouse, finger

MotionEvent

Action Code

State change that occurred

Action Values

Position and movement properties, such as time, source, location, pressure, and more

This lesson focuses on touch events read from a touch screen

MultiTouch

MultiTouch screens emit one movement trace per touch source

Individual touch sources are called pointers

MultiTouch

Each pointer has a unique ID for as long as it is active

MotionEvent can refer to multiple pointers

Each pointer has an index within the event, but that index may not be stable over time

Some MotionEvent actions

ACTION_DOWN

ACTION_POINTER_DOWN

ACTION_POINTER_UP

ACTION_MOVE

ACTION_UP

ACTION_CANCEL

Consistency Guarantees*

For touch events, Android tries to guarantee that touches

- Go down one at a time

- Move as a group

- Come up one at a time or are cancelled

Applications should be tolerant to inconsistency

MotionEvent methods

`getActionMasked()`

`getActionIndex()`

`getPointerId(int pointerIndex)`

`getPointerCount()`

`getX(int pointerIndex)`

`getY(int pointerIndex)`

`findPointerIndex (int pointerId)`

Handling Touch Events on a View

The View being touched receives

`View.onTouchEvent(MotionEvent event)`

`onTouchEvent()` should return `true` if the

`MotionEvent` has been consumed; `false` otherwise

Handling Touch Events with a Listener

`View.OnTouchListener` defines touch event callback methods

`boolean onTouch(View v, MotionEvent event)`

`View.setOnTouchListener()` registers listener for Touch callbacks

Handling Touch Events with a Listener

`onTouch()` called when a touch event, such as pressing, releasing or dragging, occurs

`onTouch()` called before the event is delivered to the touched View

Should return `true` if it has consumed the event; `false` otherwise

Handling Multiple Touch Events

Multiple touches combined to form a more complex gesture

Identify & process combinations of touches,

For example, a double tap

`ACTION_DOWN, ACTION_UP, ACTION_DOWN, ACTION_UP` in quick succession

Multi-touch Handling

Multi-touch Handling Example

	Action	IDs
1 st touch →	ACTION_DOWN	0
	ACTION_MOVE ...	0
2 nd touch →	ACTION_POINTER_DOWN	1
	ACTION_MOVE ...	0,1
1 st lift →	ACTION_POINTER_UP	0
2 nd lift →	ACTION_UP	1

Multi-touch Handling Example

	Action	IDs
1 st touch →	ACTION_DOWN	0
	ACTION_MOVE ...	0
2 nd touch →	ACTION_POINTER_DOWN	1
	ACTION_MOVE ...	0,1
2 nd lift →	ACTION_POINTER_UP	1
1 st lift →	ACTION_UP	0

Multi-touch Handling Example

	Action	ID
1 st touch →	ACTION_DOWN	0
2 nd touch →	ACTION_POINTER_DOWN	1
3 rd touch →	ACTION_POINTER_DOWN	2
	ACTION_MOVE	0,1,2
2 nd lift →	ACTION_POINTER_UP	1
1 st lift →	ACTION_POINTER_UP	0
3 rd lift →	ACTION_UP	2

TouchIndicateTouchLocation

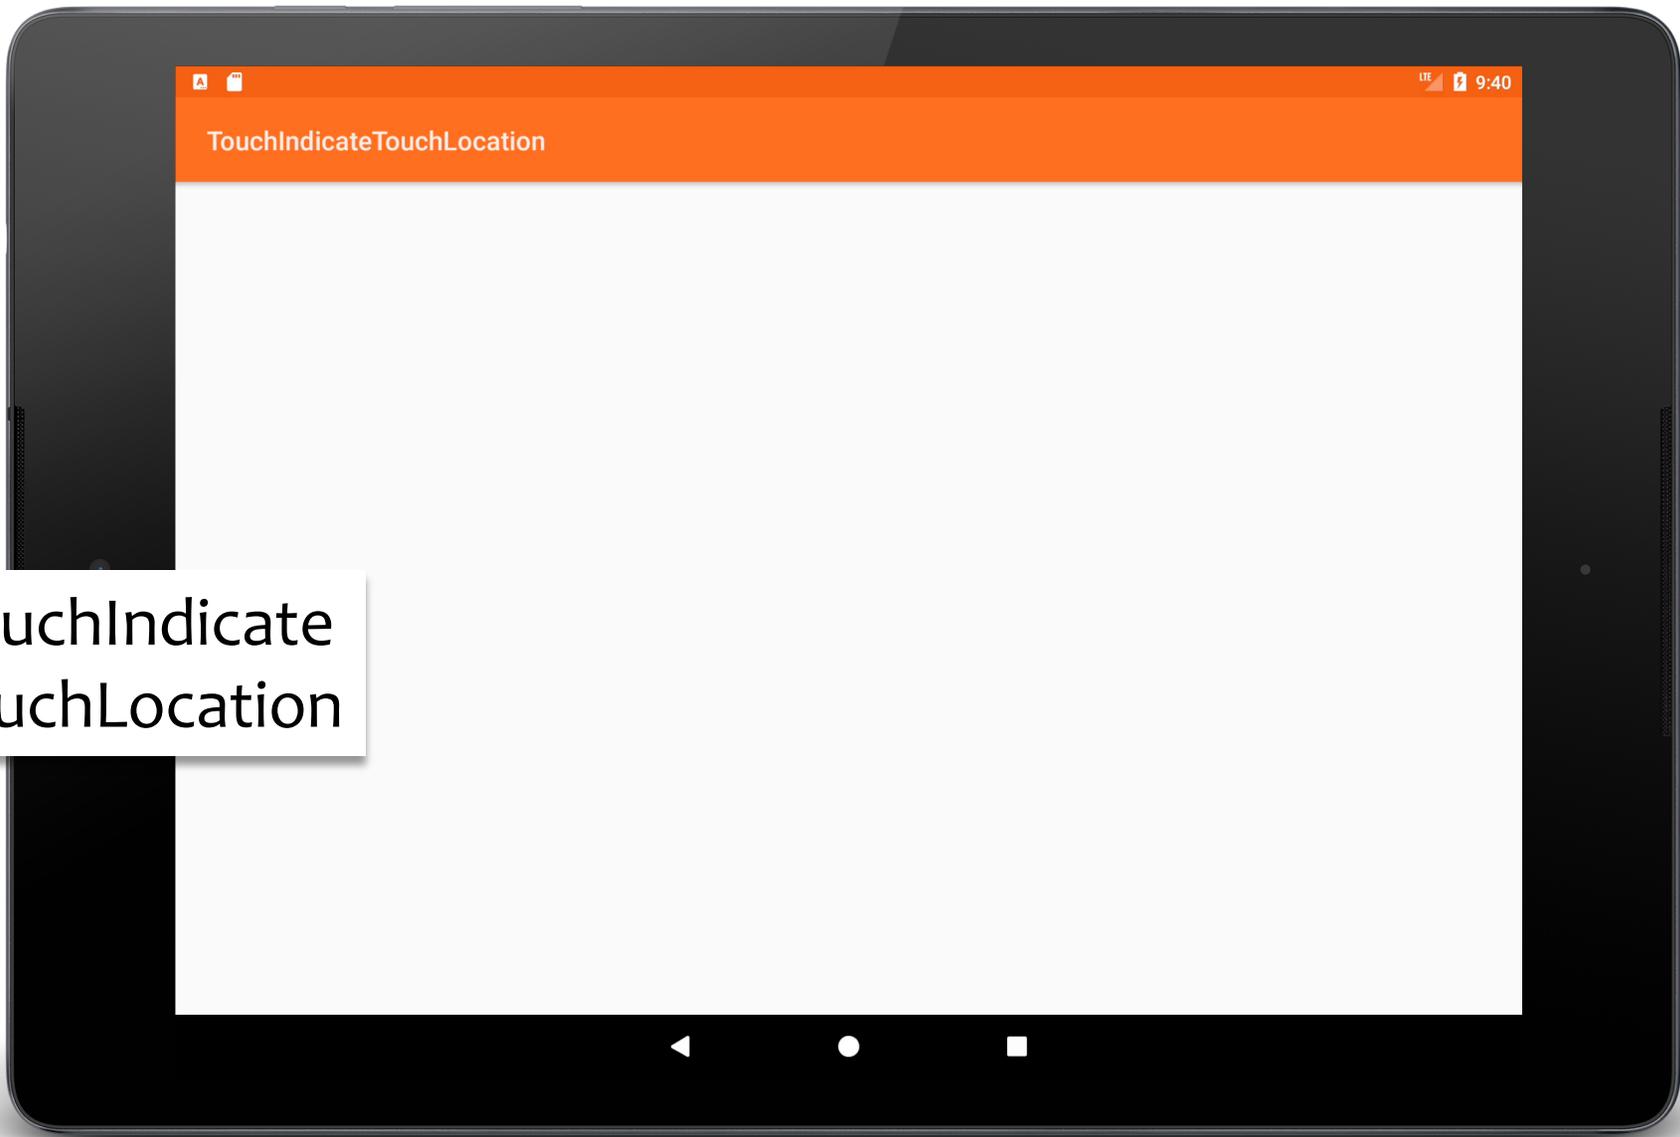

Application draws a circle wherever the users touches the screen

Circle's color is randomly selected

Redraws circles as user drags across the screen

TouchIndicateTouchLocation

The size of the circles are proportional to the number of currently active touches

TouchIndicate
TouchLocation

```
public void onCreate(Bundle savedInstanceState) {  
    ...  
    mFrame = findViewById(android.R.id.content);  
  
    // Initialize pool of View.  
    initView();  
  
    ...  
}  
  
private void initView() {  
    for (int idx = 0; idx < MAX_TOUCHES; idx++) {  
        mInactiveMarkers.add(new MarkerView(this, -1, -1));  
    }  
}
```

```
public void onCreate(Bundle savedInstanceState) {  
    ...  
    // Create and set on touch listener  
    mFrame.setOnTouchListener(new OnTouchListener() {  
        public boolean onTouch(View v, MotionEvent event) {  
            ...  
        }  
    })  
}
```

...

```
switch (event.getActionMasked()) {  
    // Show new MarkerView  
    case MotionEvent.ACTION_DOWN:  
    case MotionEvent.ACTION_POINTER_DOWN: {  
        int pointerIndex = event.getActionIndex();  
        int pointerID = event.getPointerId(pointerIndex);  
        MarkerView marker = mInactiveMarkers.remove();  
        if (null != marker) {  
            mActiveMarkers.put(pointerID, marker);  
            marker.setXLoc(event.getX(pointerIndex));  
            marker.setYLoc(event.getY(pointerIndex));  
            updateTouches(mActiveMarkers.size());  
            mFrame.addView(marker);  
        }  
        break;  
    }  
}
```

...

```
// Remove one MarkerView
case MotionEvent.ACTION_UP:
case MotionEvent.ACTION_POINTER_UP: {
    int pointerIndex = event.getActionIndex();
    int pointerID = event.getPointerId(pointerIndex);
    MarkerView marker = mActiveMarkers.remove(pointerID);
    if (null != marker) {
        mInactiveMarkers.add(marker);
        updateTouches(mActiveMarkers.size());
        mFrame.removeView(marker);
    }
    break;
}
...
```

```
// Move all currently active MarkerViews
case MotionEvent.ACTION_MOVE: {
    for (int idx = 0; idx < event.getPointerCount(); idx++) {
        int ID = event.getPointerId(idx);
        MarkerView marker = mActiveMarkers.get(ID);
        if (null != marker) {
            // Redraw only if finger has traveled a minimum distance
            if (Math.abs(marker.getXLoc() - event.getX(idx)) > MIN_DXDY
                || Math.abs(marker.getYLoc() - event.getY(idx)) > MIN_DXDY) {
                // Set new location
                marker.setXLoc(event.getX(idx));
                marker.setYLoc(event.getY(idx));
                // Request re-draw
                marker.invalidate();
                ...
            }
        }
    }
    return true;
}
```

```
private class MarkerView extends View {  
    ...  
    public MarkerView(Context context, float x, float y) {  
        super(context);  
        mX = x;    mY = y;  
        mPaint.setStyle(Style.FILL);  
        Random rnd = new Random();  
        mPaint.setARGB(255, rnd.nextInt(256), rnd.nextInt(256),  
            rnd.nextInt(256));  
    }  
    ...  
    protected void onDraw(Canvas canvas) {  
        canvas.drawCircle(mX, mY, MAX_SIZE / mTouches, mPaint);  
    }  
}
```

GestureDetector

A class that recognizes common touch gestures

Some built-in gestures include confirmed single tap, double tap, fling

GestureDetector

Activity creates a GestureDetector which implements GestureDetector.

OnGestureListener interface

Activity will receive calls to onTouchEvent() when Activity is touched

onTouchEvent delegates call to GestureDetector.OnGestureListener

TouchGestureViewFlipper

Shows a TextView displaying a number

If the user performs a right to left “fling” gesture,

The TextView will scroll off the screen

A new TextView will scroll in behind it

TouchGesture
ViewFlipper

```
<ViewFlipper xmlns:android="http://schemas.android.com/apk/res/android"
  android:id="@+id/view_flipper"
  android:layout_width="match_parent"
  android:layout_height="match_parent">
  <include
    layout="@layout/first"
    android:layout_width="wrap_content"
    android:layout_height="wrap_content"
    android:layout_gravity="center_horizontal"/>
  <include
    layout="@layout/second"
    android:layout_width="wrap_content"
    android:layout_height="wrap_content"
    android:layout_gravity="center_horizontal"/>
</ViewFlipper>
```

```
<merge xmlns:android="http://schemas.android.com/apk/res/android">
  <TextView
    android:id="@+id/textView1"
    android:layout_width="match_parent"
    android:layout_height="match_parent"
    android:layout_gravity="center"
    android:gravity="center"
    android:textAppearance="@android:style/TextAppearance.Material.Display4"
    android:textSize="@dimen/text_size"/>
</merge>
```

```
public void onCreate(Bundle savedInstanceState) {  
    ...  
    mGestureDetector = new GestureDetector(this,  
        new GestureDetector.SimpleOnGestureListener() {  
            public boolean onFling(MotionEvent e1, MotionEvent e2,  
                                   float velocityX, float velocityY) {  
                if (velocityX < -10.0f) {  
                    mCurrentLayoutState = mCurrentLayoutState == 0 ? 1 : 0;  
                    switchLayoutStateTo(mCurrentLayoutState);  
                }  
                return true;  
            }  
        }  
    }  
});
```

```
public boolean onTouchEvent(MotionEvent event) {  
    return mGestureDetector.onTouchEvent(event);  
}
```

```
private void switchLayoutStateTo(int switchTo) {  
    mCurrentLayoutState = switchTo;  
  
    mFlipper.setInAnimation(inFromRightAnimation());  
    mFlipper.setOutAnimation(outToLeftAnimation());  
  
    mCount++;  
  
    if (switchTo == 0) {  
        mTextView1.setText(String.valueOf(mCount));  
    } else {  
        mTextView2.setText(String.valueOf(mCount));  
    }  
  
    mFlipper.showPrevious();  
}
```

```
private Animation inFromRightAnimation() {  
    Animation inFromRight = new TranslateAnimation(  
        Animation.RELATIVE_TO_PARENT, +1.0f,  
        Animation.RELATIVE_TO_PARENT, 0.0f,  
        Animation.RELATIVE_TO_PARENT, 0.0f,  
        Animation.RELATIVE_TO_PARENT, 0.0f);  
    inFromRight.setDuration(500);  
    inFromRight.setInterpolator(new LinearInterpolator());  
    return inFromRight;  
}
```

```
private Animation outToLeftAnimation() {  
    Animation outToLeft = new TranslateAnimation(  
        Animation.RELATIVE_TO_PARENT, 0.0f,  
        Animation.RELATIVE_TO_PARENT, -1.0f,  
        Animation.RELATIVE_TO_PARENT, 0.0f,  
        Animation.RELATIVE_TO_PARENT, 0.0f);  
    outToLeft.setDuration(500);  
    outToLeft.setInterpolator(new LinearInterpolator());  
    return outToLeft;  
}
```

Creating Custom Gestures

The GestureBuilder application lets you create & save custom gestures

Comes bundled with SDK

Creating Custom Gestures

GestureLibraries supports loading custom gestures & then recognizing them at runtime

Creating Custom Gestures

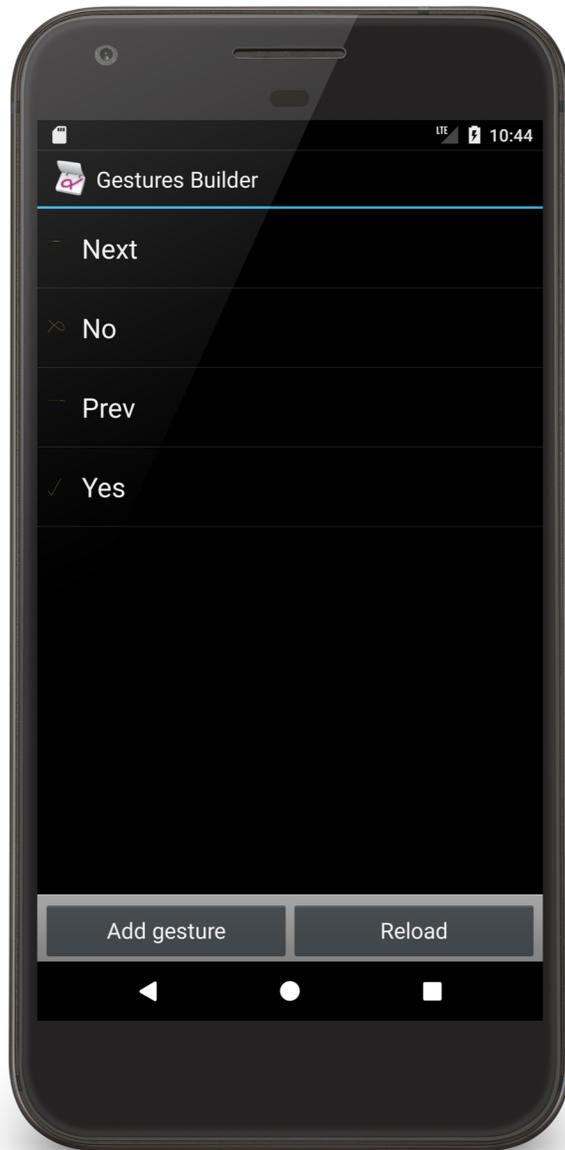

Include a `GestureOverlayView` in your layout

The Overlay intercepts user gestures and invokes your application code to handle them

GestureBuilder

Stores gestures to `/mnt/sdcard/gestures`

Copy this file to `/res/raw` directory

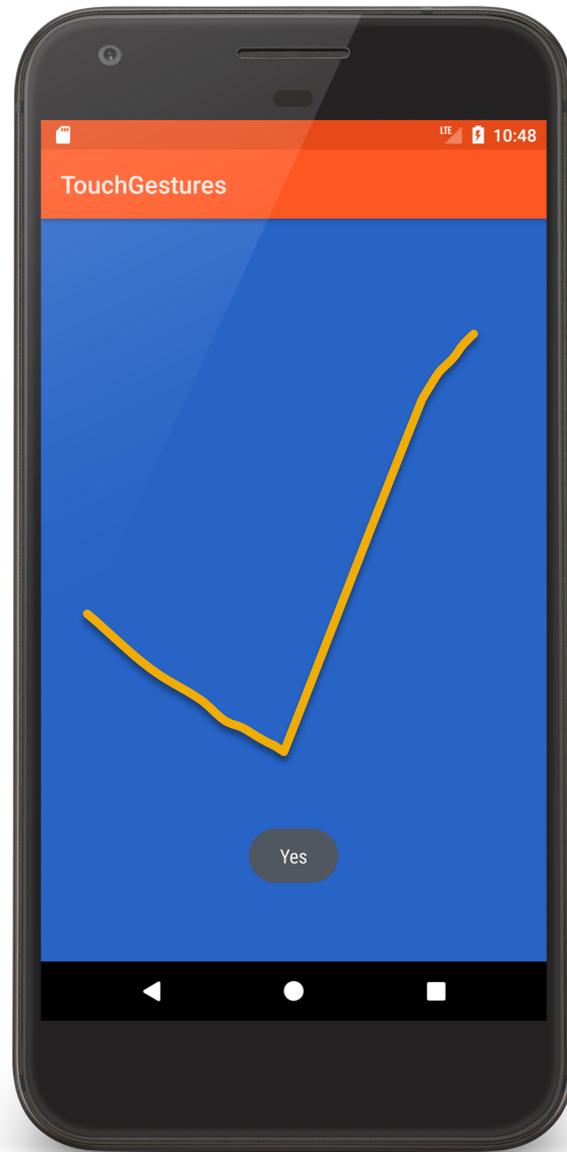

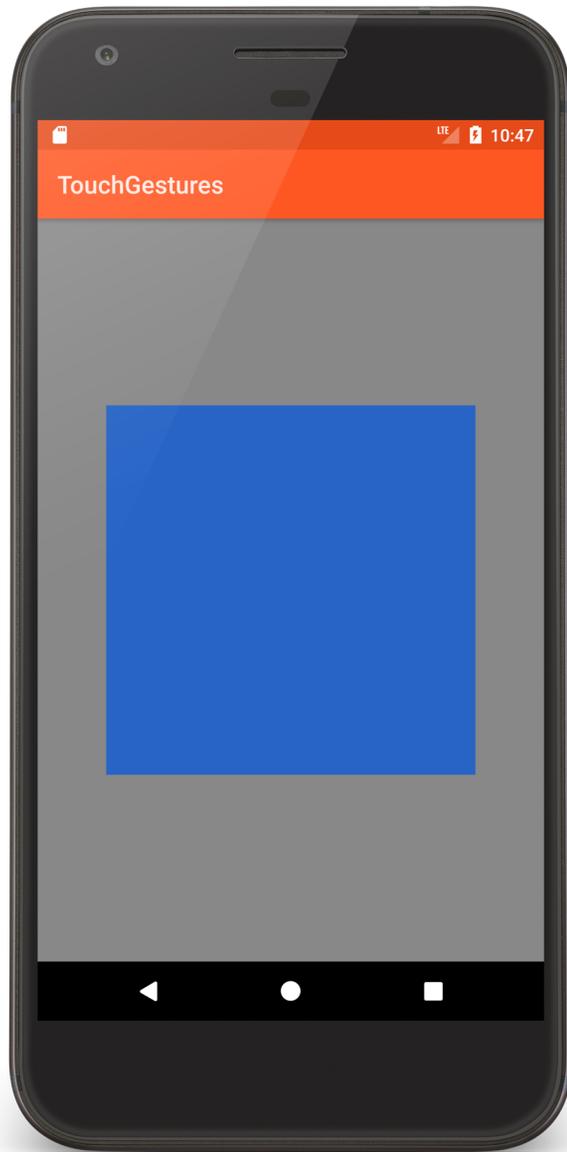

Touch Gestures

Application displays a small View with a colored background

User can swipe left and right to cycle between different candidate background colors

Can make an check or X-like gesture to set or cancel the application's current background color

Touch Gestures

```
<RelativeLayout xmlns:android="http://schemas.android.com/apk/res/android"
    android:id="@+id/main"
    android:layout_width="match_parent"
    android:layout_height="match_parent">
    <android.gesture.GestureOverlayView
        android:id="@+id/gestures_overlay"
        android:layout_width="match_parent"
        android:layout_height="match_parent"
        android:layout_centerInParent="true" >
        <FrameLayout
            android:id="@+id/frame"
            android:layout_width="@dimen/target_size"
            android:layout_height="300dp"
            android:layout_gravity="center" >
            </FrameLayout>
        </android.gesture.GestureOverlayView>
    </RelativeLayout>
```

```
public class GesturesActivity extends Activity implements OnGesturePerformedListener {  
...  
  public void onCreate(Bundle savedInstanceState) {  
    ...  
    // Add gestures file - contains 4 gestures: Prev, Next, Yes, No  
    mLibrary = GestureLibraries.fromRawResource(this, R.raw.gestures);  
    if (!mLibrary.load()) {  
      finish();  
    }  
  
    // Make this the target of gesture detection callbacks  
    GestureOverlayView gestureView = findViewById(R.id.gestures_overlay);  
    gestureView.addOnGesturePerformedListener(this);  
  
  }  
}
```

```
public void onGesturePerformed(GestureOverlayView overlay, Gesture gesture) {
```

```
// Get gesture predictions
```

```
ArrayList<Prediction> predictions = mLibrary.recognize(gesture);
```

```
// Get highest-ranked prediction
```

```
if (predictions.size() > 0) {
```

```
    Prediction prediction = predictions.get(0);
```

```
    ...
```

// Ignore weak predictions

```
if (prediction.score > 2.0) {  
  switch (prediction.name) {  
    case PREV:  
      mBgColor -= 100;  
      mFrame.setBackgroundColor(mBgColor);  
      break;  
  
    case NEXT:  
      mBgColor += 100;  
      mFrame.setBackgroundColor(mBgColor);  
      break;  
  
    case YES:  
      mLayout.setBackgroundColor(mBgColor);  
      break;  
    ...
```

case NO:

```
    mLayout.setBackgroundColor(mStartBgColor);  
    mFrame.setBackgroundColor(mFirstColor);  
    break;
```

```
}
```

```
Toast.makeText(this, prediction.name, Toast.LENGTH_SHORT).show();
```

```
} else {
```

```
    Toast.makeText(this, "No prediction", Toast.LENGTH_SHORT).show();
```

```
}
```

```
} else {
```

```
    Toast.makeText(this, "No prediction", Toast.LENGTH_SHORT).show();
```

```
}
```

```
}
```

```
}
```
