CMSC 330: Organization of Programming Languages

Lets, Tuples, Records

Let Expressions

- Syntax
  - **`let` *`x`* `=` *`e1`* `in` *`e2`***
  - ***`x`*** is a *bound variable*
  - ***`e1`*** is the *binding expression*
  - ***`e2`*** is the *body expression*

- **`let`** expressions bind *local* variables
  - Different from **`let`** *definitions*, which are at the top-level

Let Expressions

- Syntax
  - `let x = e1 in e2`

- Evaluation
  - Evaluate *e1* to *v1*
  - Substitute *v1* for *x* in *e2*
    - yielding new expression *e2'*
  - Evaluate *e2'* to *v2*, the final result

Example (*x*, *e1*, *e2*)

```
let z = 3+4 in 3*z
```

(evaluate *e1*)

➢ `let z = 7 in 3*z`

(substitute for var `z` in *e2*)

➢ `3*7`

(compute the final result)

➢ `21`

Let Expressions

- Syntax
  - **`let`** ***`x`*** **`=`** ***`e1`*** **`in`** ***`e2`***

- Type checking

Example

What is the type of **`let z = 3+4 in 3*z`** ?

- **`3+4`** : **`int`**
- Assuming **`z`** : **`int`**, we have **`3*z`** : **`int`**
- So the type of **`let z = 3+4 in 3*z`** is **`int`**

Let Expressions

- Syntax
  - **`let`** ***`x`*** **`=`** ***`e1`*** **`in`** ***`e2`***
- Type checking
  - If ***`e1`*** : ***`t1`*** and
  - If assuming ***`x`*** : ***`t1`*** implies ***`e2`*** : ***`t`***
  - Then (**`let`** ***`x`*** **`=`** ***`e1`*** **`in`** ***`e2`***) : ***`t`***

Example

What is the type of **`let z = 3+4 in 3*z`** ?

- **`3+4`** : **`int`**
- Assuming **`z`** : **`int`**, we have **`3*z`** : **`int`**
- So the type of **`let z = 3+4 in 3*z`** is **`int`**

Let Definitions vs. Let Expressions

- At the top-level, we write
  - `let x = e;;` (* no `in e2` part *)
  - This is called a let *definition*, not a let *expression*
    - Because it doesn't, itself, evaluate to anything

- Omitting in means "from now on":

```
# let pi = 3.14;;
(* pi is now bound in the rest of the top-level scope *)
```

Top-level expressions

- We can write any expression at top-level, too
  - `e;;`
  - This says to evaluate `e` and then ignore the result
    - Equivalent to `let _ = e;;`
    - Useful when `e` has a side effect, such as reading/writing a file, printing to the screen, etc.

```
let x = 37;;
let y = x + 5;;
print_int y;;
print_string "\n";;
```

    - When run, outputs `42` to the screen

Let Expressions: Scope

- In **`let x = e1 in e2`**, var ***x*** is *not* visible outside of ***e2***

```
let pi = 3.14 in pi *. 3.0 *. 3.0;;
print_float pi;;
```

error: **`pi`** not bound

bind **`pi`** (only) in body of **`let`**
(which is **`pi *. 3.0 *. 3.0`**)

Binding in other languages

- In **`let x = e1 in e2`**, var ***x*** is *not* visible outside of ***e2***

```
let pi = 3.14 in pi *. 3.0 *. 3.0;;
print_float pi;; (* pi unbound! *)
```

- Compare to similar usage in Java/C

```
{
  float pi = 3.14;

  pi * 3.0 * 3.0;
}
pi; /* pi unbound! */
```

Examples – Scope of Let bindings

- x;;
  - (* Unbound value x *)
- let x = 1 in x + 1;;
  - (* 2 *)
- let x = x in x + 1;;
  - (* Unbound value x *)

Examples – Scope of Let bindings

- let x = 1 in (x + 1 + x) ;;
  - (* 3 *)

- (let x = 1 in x + 1) ;;

  x;;
  - (* Unbound value x *)

- let x = 4 in (let x = x + 1 in x) ;;
  - (* 5 *)

Nested Let Expressions

- Uses of let can be nested (last example on prev. slide)
  - Nested bound variables (`pi` and `r`) not visible outside

- Similar scoping possibilities C and Java

```
let res =
  (let area =
    (let pi = 3.14 in
    let r = 3.0 in
    pi *. r *. r) in
  area /. 2.0);;
```

```
float res;
{ float area;
  { float pi = 3.14
    float r = 3.0;
    area = pi * r * r;
  }
  res = area / 2.0;
}
```

Nested Let Style: Generally Avoid

- Sometimes a nested binding can be rewritten in a more linear style
  - Easier to understand
- Can go too far: namespace pollution
  - Avoiding adding unnecessary variable bindings to top-level

```
let res =
  (let area =
    (let pi = 3.14 in
     let r = 3.0 in
     pi *. r *. r) in
   area /. 2.0);;
```

```
let res =
  let pi = 3.14 in
  let r = 3.0 in
  let area = pi *. r *. r in
  area /. 2.0;;
```

```
let pi = 3.14;;
let r = 3.0;;
let area = pi *. r *. r;;
let res = area /. 2.0;;
```

Let Expressions in Functions

- You can use let inside of functions for local vars

```
let area r =
  let pi = 3.14 in
  pi *. r *. r
```

  - And you can use many lets in sequence

```
let area d =
  let pi = 3.14 in
  let r = d /. 2.0 in
  pi *. r *. r
```

Shadowing Names

- Shadowing is rebinding a name in an inner scope to have a different meaning
  - May or may not be allowed by the language

C

```
int i;

void f(float i) {
  {
    char *i = NULL;
    ...
  }
}
```

Java

```
void h(int i) {
  {
    float i; // not allowed
    ...
  }
}
```

OCaml

```
let x = 3;;
let g x = x + 3;;
```

Shadowing, by the Semantics

- What if ***e2*** is also a **`let`** for ***x*** ?
  - Substitution will **stop** at the ***e2*** of a shadowing ***x***

Example

```
let x = 3+4 in let x = 3*x in x+1
➢let x = 7 in let x = 3*x in x+1
➢let x = 3*7 in x+1
➢let x = 21 in x+1
➢21+1
➢22
```

Will *not* be substituted, since it is shadowed by the inner let

Shadowing (of Locals) Discouraged

- You can use shadowing to *simulate* update (mutation)

```
let rec f x n =
  if x = 0 then 1
  else
    let x = x - 1 in (* shadowed *)
    n * (f x n)
```

- But avoiding shadowing is clearer
  - With no shadowing, if you see a variable **x**, you know it hasn't been "changed," no matter where it appears
  - If you want to "update" **n**, use a new name **n1**, **n'** , etc.

Quiz 1

Which of these is **not** an expression that evaluates to 3?

A. `let x=2 in x+1`

B. `let x=3 in x`

C. `let x=3`

D. `3`

Quiz 1

Which of these is **not** an expression that evaluates to 3?

A. `let x=2 in x+1`

B. `let x=3 in x`

C. `let x=3` ---> not an expression

D. `3`

Quiz 2: What does this evaluate to?

```
let x = 2 in
x = 3
```

A. 3

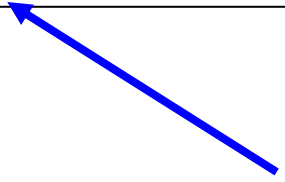
B. 2

C. true

D. false

Quiz 2: What does this evaluate to?

```
let x = 2 in
x = 3
```



This expression is checking whether `x` is equal to `3`

A. 3

B. 2

C. true

D. false

Quiz 3: What does this evaluate to?

```
let y = 3 in
let x = y+2 in
let y = 6 in
x+y
```

A. 8

B. 11

C. 13

D. 14

Quiz 3: What does this evaluate to?

```
let y = 3 in
let x = y+2 in
let y = 6 in
x+y
```

A. 8

B. 11

C. 13

D. 14

`let` Specializes `match`

More general form of let allows patterns:

- **`let` *`p`* `=` *`e1`* `in` *`e2`***
  - where *`p`* is a pattern. If *`e1`* fails to match that pattern then an exception is thrown

This pattern form of **`let`** is equivalent to

- **`match` *`e1`* `with` *`p`* `->` *`e2`***

Examples

- `let [x] = [[1]] in 1::x  (* evals to [1;1] *)`
- `let h::_ = [1;2;3] in h (* evaluates to 1 *)`
- `let () = print_int 5 in 3 (* evaluates to 3 *)`

Tuples

- Constructed using `(e1, …, en)`
- Deconstructed using pattern matching
  - Patterns involve parens and commas, e.g., `(p1, p2, …)`
- Tuples are similar to C structs
  - But without field labels
  - Allocated on the heap
- Tuples can be heterogenous
  - Unlike lists, which must be homogenous
  - `(1, ["string1";"string2"])` is a valid tuple

Tuple Types

- Tuple types use **`*`** to separate components
  - Type joins types of its components
- Examples
  - `(1, 2) :`
  - `(1, "string", 3.5) :`
  - `(1, ["a"; "b"], 'c') :`
  - `[(1,2)] :`
  - `[(1, 2); (3, 4)] :`
  - `[(1,2); (1,2,3)] :`

Tuple Types

- Tuple types use ***** to separate components
  - Type joins types of its components
- Examples
  - `(1, 2) :` **`int * int`**
  - `(1, "string", 3.5) :` **`int * string * float`**
  - `(1, ["a"; "b"], 'c') :` **`int * string list * char`**
  - `[(1,2)] :` **`(int * int) list`**
  - `[(1, 2); (3, 4)] :` **`(int * int) list`**
  - `[(1,2); (1,2,3)] :` ***`error`***

Because the first list element has type int * int, but the second has type int * int * int – list elements must all be of the same type

Pattern Matching Tuples

```
# let plusThree t =
  match t with
   (x, y, z) -> x + y + z;;
plusThree : int*int*int -> int = <fun>

# let plusThree' (x, y, z) = x + y + z;;
plusThree' : int*int*int -> int = <fun>

# let addOne (x, y, z) = (x+1, y+1, z+1);;
addOne : int*int*int -> int*int*int = <fun>

# plusThree (addOne (3, 4, 5));;
- : int = 15
```

Remember, **semicolon** for lists, **comma** for tuples

- `[1, 2] = [(1, 2)]` *which is a list of size one*
- `(1; 2)` ***Warning: This expression should have type unit***

Tuples Are A Fixed Size

- This OCaml definition
  - ```
    let foo x = match x with
      (a, b) -> a + b
    | (a, b, c) -> a + b + c
    ```

  has a type error. Why?

- Tuples of different size have different types
  - `(a, b) has type: 'a * 'b`
  - `(a, b, c) has type: 'a * 'b * 'c`
  - Patterns in the same **`match`** must have the same type
    ```

Quiz 4: What does this evaluate to?

```
let get a b = (a+b,0) in
get 1 2
```

A. (3,0)
B. (2,0)
C. 3
D. type error

Quiz 4: What does this evaluate to?

```
let get a b = (a+b,0) in
get 1 2
```

A. (3,0)

B. (2,0)

C. 3

D. type error

Quiz 5: What does this evaluate to?

```
let get (a,b) y = a+y in
get (2,1) 1
```

A. 3
B. type error
C. 2
D. 1

Quiz 5: What does this evaluate to?

```
let get (a,b) y = a+y in
get (2,1) 1
```

A. 3

B. type error

C. 2

D. 1

Records

- Records: identify elements by name
  - Elements of a tuple are identified by position

- Define a record type before defining record values

```
type date = { month: string; day: int; year: int }
```

- Define a record value

```
# let today = { day=16; year=2017; month="f"^"eb" };;

today : date = { day=16; year=2017; month="feb" };;
```

Destructing Records

```
type date = { month: string; day: int; year: int }
let today = { day=16; year=2017; month="feb" };;
```

- Access by field name or pattern matching

```
print_string today.month;; (* prints feb *)
(* patterns *)
let { month=_; day=d } = today in
let { year } = today in
let _ = print_int d in     (* prints 16 *)
print_int year;;           (* prints 2017 *)
```

- Notes:
  - In record patterns, you can skip or reorder fields
  - You can use the field name as the bound variable

Quiz 6: What is the type of `shift`?

```
type point = {x:int; y:int}

let shift { x=px } = [px]::[]
```

A. `point -> int list`

B. `int -> int list`

C. `point -> point list`

D. `point -> int list list`

Quiz 6: What is the type of **`shift`**?

```
type point = {x:int; y:int}

let shift { x=px } = [px]::[]
```

A. `point -> int list`

B. `int -> int list`

C. `point -> point list`

D. `point -> int list list`
