CMSC 330: Organization of Programming Languages

Strings, Slices, Vectors, HashMaps in Rust

CMSC 330 -Fall 2021

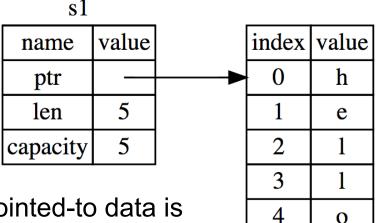

Copyright © 2018 Michael Hicks, the University of Maryland. Some material based on https://doc.rust-lang.org/book/second-edition/index.html

String Representation

- Rust's String is a 3-tuple
 - A pointer to a byte array (interpreted as UTF-8)
 - A (current) length
 - A (maximum) capacity

Always: length \leq capacity

0

String pointed-to data is dropped when the owner is

String Representation

- Rust's String is a 3-tuple
 - A pointer to a byte array (interpreted as UTF-8)
 - A (current) length
 - A (maximum) capacity
 - Always: length ≤ capacity

```
      Code
      Prints

      let mut s = String::new();
      0

      println!("{}", s.capacity());
      0

      for _ in 0..5 {
      5,5

      s.push_str("hello");
      10,10

      println!("{},{}",
      15,20

      s.len(),s.capacity());
      20,20

      }
      25,40
```

UTF-8 and Rust Strings

- UTF-8 is a variable length character encoding
 - The first 128 characters (US-ASCII) need one byte
 - The next 1,920 characters need two bytes, which covers the remainder of almost all Latin-script alphabets, ... up to 4 bytes
- You may not index a string directly; Rust stops you

- You could end up in the middle of a character!

```
let s1 = String::from("hello");
let h = s1[0]; // rejected
```

Slices: Motivation

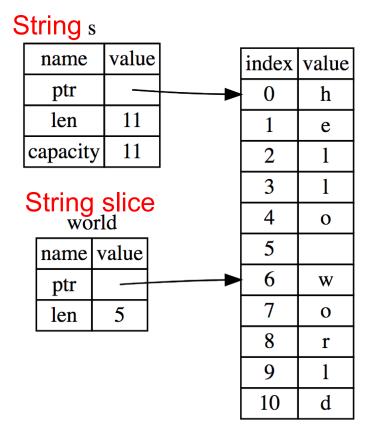

- Suppose we want the first word of a string
- Here's how we might do it in OCaml

```
let first_word s =
  try
   let i = String.index s ' ' in
   String.sub s 0 i
  with Not_found -> s
```

- String. sub allocates new memory and copies the substring's contents
 - This is a waste (especially with a large string) if both s and its substring are to be treated as immutable

Slice: Shared Data, Separate Metadata

- What we want is to have both strings share the same underlying data
- Happily, Rust's containers permit a way to reference a portion of an object's contents
 - These are called slices

String Slices in Rust

- If s is a String, then &s [range] is a string slice, where range can be as follows
 - *i*. *j* is the range from *i* to *j*, inclusive
 - -i. is the range from *i* to the current length
 - ... j is the range from 0 to j
 - . . is the range from 0 to the current length
- **&str** is the type of a **String** slice

String Slice Example

• Here's first word in Rust, using slices:

```
pub fn first_word (s: &String) -> &str {
   for (i, item) in s.char_indices() {
      if item == ' ' {
        return &s[0..i];
      }
   }
   s.as_str()
}
```

 If we used s.as_bytes() we could end up examining one byte of a multi-byte character, due to the UTF-8 encoding

String Slices and Ownership

- A &str slice borrows from the original string
 - Just like an immutable String reference
 - This prevents dangling pointers

```
let mut s = String::from("hello world");
let word = first_word(&s); //borrow
s.clear(); // Error! Can't take mut ref
```

• Recall borrowing rules:

```
let b = &s[..];
let c = &s[..];
print!("{}{}", b, c);
```

- Multiple immutable refs, or
- Only one mutable ref (no immut ones)

let b = &mut s[..]; let c = &mut s[..]; //error print!("{}{}", b, c);

```
let s = String::from("Rust is fun!");
let h = &s[0..4];
println!("{}",h);
```

A. RustB. isC. fun!D. Type Error

```
let s = String::from("Rust is fun!");
let h = &s[0..4];
println!("{}",h);
```

```
A. RustB. isC. fun!D. Type Error
```

String Slices are (should be) the Default

• String literals are slices

let s:&str = "hello world";

- Variable s is not the owner of this string data
 - · the compiler establishes a static owner to permit free immutable sharing
- Strings do own their data; useful if you want to modify it
- Should use slices where possible
 - E.g., earlier example: fn first_word(s:&str) -> &str
 - Can convert String s to a slice via &s[..]. Oftentimes, this coercion is done automatically (due to Deref trait)

Useful String Operations

- push_str(&mut self, string: &str)
 - string argument is a slice, so doesn't take ownership, while
 self is a mutable reference, implying it is the only one
- What's wrong with this example?

```
let mut s = String::from("abc");
let (a, b) = (s.push_str("def"), s.push_str("ghi"));
```

- Compiler complains
 - cannot borrow s as mutable more than once at a time
- How to fix? Put push_str calls in separate lets
- Reference: https://doc.rust-lang.org/book/ch08-02-strings.html
 https://doc.rust-lang.org/std/string/struct.String.html

Quiz 2: What is the output?

```
let mut s1 = String::from("Hello");
let s2 = " World";
s1.push_str(s2);
print!("{}",s2);
```

- A. World
- B. Hello World
- C. Error because s2 transferred the ownership

Quiz 2: What is the output?

```
let mut s1 = String::from("Hello");
let s2 = " World";
s1.push_str(s2);
print!("{}",s2);
```

A. World. push_str() function does not take the ownership of the parameter

- B. Hello World
- C. Error because s2 transferred the ownership

Quiz 3: What is the output?

```
let s1 = String::from("CMSC");
let s3; //deferred init
{
    let s2 = String::from("330");
    s3 = s1 + \& s2;
}
print!("{}",s3);
print!("{}",s1);
     A. CMSC330
     B. CMSC
     C. CMSC330CMSC
     D. Error.
```

Quiz 3: What is the output?

```
let s1 = String::from("CMSC");
let s3; //deferred init
{
    let s2 = String::from("330");
    s3 = s1 + \& s2;
}
print!("{}",s3);
print!("{}",s1);
     A. CMSC330
     B. CMSC
     C. CMSC330CMSC
     D. Error. s1 lost ownership
```

Vectors: Basics

• Vec<T> in Rust is Arraylist<T> in Java

{ let mut v:Vec<i32> = Vec::new(); v.push(1); // adds 1 to v v.push("hi"); //error - v contains i32s let w = vec![1, 2, 3]; //vec! is a macro } // v,w and their elements dropped

• Indexing can fail (panic) or return an Option

```
let v = vec![1, 2, 3, 4, 5];
let third:&i32 = &v[2]; //panics if OOB
let third:Option<&i32> = v.get(2); //None if OOB
```

https://doc.rust-lang.org/book/second-edition/ch08-01-vectors.html

Aside: Options

- **Option**<**T**> is an enumerated type, like an OCaml variant
 - Some (v) and None are possible values

```
let v = vec![1, 2, 3, 4, 5];
let third: Option<&i32> = v.get(2);
let z =
    match third {
        Some(i) => Some(i+1), //matches here
        None => None
    };
```

- We'll see more about enumerated types later
 - For now, follow your nose

Vectors: Updates and Iteration

```
let mut a = vec![10, 20, 30, 40, 50];
{ let p = &mut a[1]; //mutable borrow
 *p = 2; //updates a[1]
}//ownership restored
println!("vector contains {:?}",&a);
```

- If we remove the { } block around the def of p, above, then the code fails
 - Not allowed to print via a while mutable borrow p is out
- Iterator variable can be mutable or immutable:

```
let mut v = vec![100, 32, 57];
for i in &v { println!("{}", i); }
for i in &mut v { *i += 50; }
```

Vector and Strings

• Like Strings, vectors can have slices

let a = vec![10, 20, 30, 40, 50]; let b = &a[1..3]; //[20,30] let c = &b[1]; //30 println!("{}",c); //prints 30

- Strings implemented internally as a Vec<u8>
 - But: don't mess with the byte-level representation of UTF-8 strings.

HashMaps

- HashMap<K, V> has the expected methods (roughly see manual for gory details)
 - new : () -> HashMap<K,V>
 - insert : (K,V) -> Option<V>
 - get : (&K) -> Option<&V>
- See also
 - get_mut, entry, and or_insert

https://doc.rust-lang.org/book/second-edition/ch08-03-hash-maps.html https://doc.rust-lang.org/std/collections/struct.HashMap.html

Quiz 4: What is the output?

```
use std::collections::HashMap;
fn main() {
    let mut h = HashMap::new();
    h.insert("Alice", "1");
    h.insert("Bob", "2");
   match h.get(&"Alice") {
        Some(&id) => println!("Alice:{}",id),
        => println!("Not Found"),
    }
                       A. Alice:1
                       B. Not Found
                       C. Error
```

Quiz 4: What is the output?

```
use std::collections::HashMap;
fn main() {
    let mut h = HashMap::new();
    h.insert("Alice", "1");
    h.insert("Bob", "2");
   match h.get(&"Alice") {
        Some(&id) => println!("Alice:{}",id),
        => println!("Not Found"),
    }
                       A. Alice:1
                       B. Not Found
```

C. Error
