CMSC436: Programming Handheld Systems

Application Fundamentals

Application Components

Activity

Service

BroadcastReceiver

ContentProvider

Applications

Apps are made from components

Android instantiates and runs them as needed

Each component has its own purpose and APIs

Apps can have multiple “entry points”

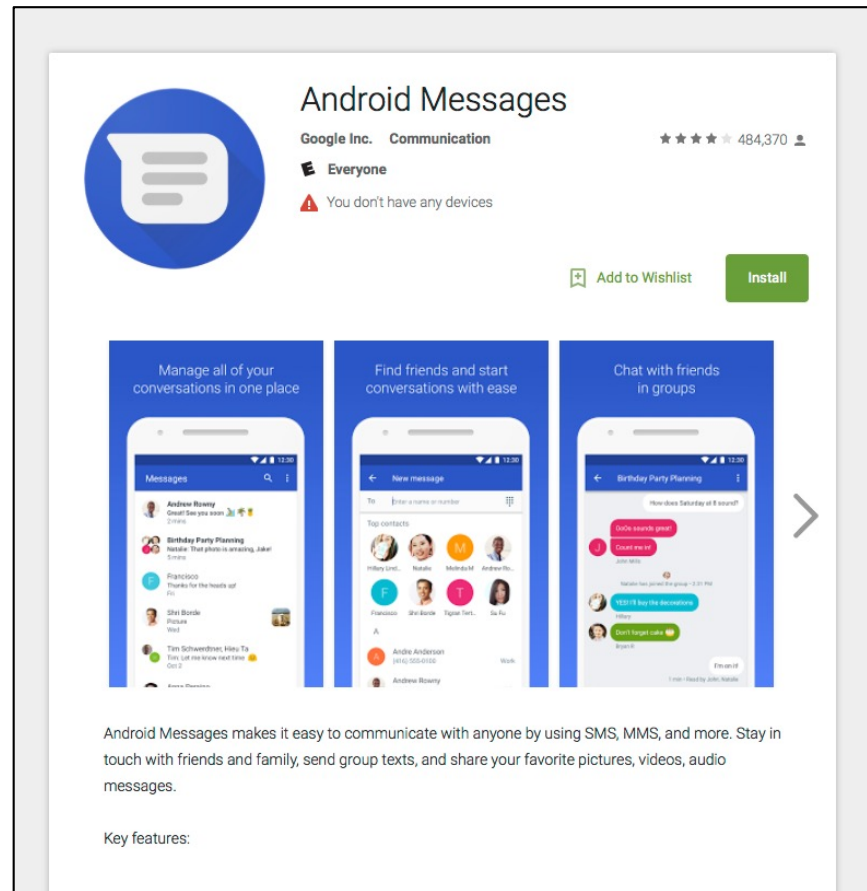

Activity

Primary class for user interaction

Conceptually implements a single, focused task that the user can do

Implementation changes slightly with introduction of Fragments (discussed later in the course)

Example App Android Messages

The screenshot shows the Google Play Store page for the 'Android Messages' app. At the top left is the app's icon, a blue circle with a white speech bubble. To its right, the app name 'Android Messages' is displayed in a large, bold font. Below the name, it says 'Google Inc. Communication' and shows a 4.5-star rating with 484,370 reviews. A warning icon and text state 'You don't have any devices'. There are two buttons: 'Add to Wishlist' and 'Install'. Below this information are three preview images of the app's interface. The first image shows the 'Messages' inbox with a list of conversations. The second image shows the 'New message' screen with a search bar and a list of contacts. The third image shows a group chat titled 'Birthday Party Planning' with various messages and reactions. Below the preview images is a paragraph of text describing the app's features and a 'Key features:' section.

Android Messages

Google Inc. Communication ★★★★☆ 484,370

Everyone

You don't have any devices

Add to Wishlist Install

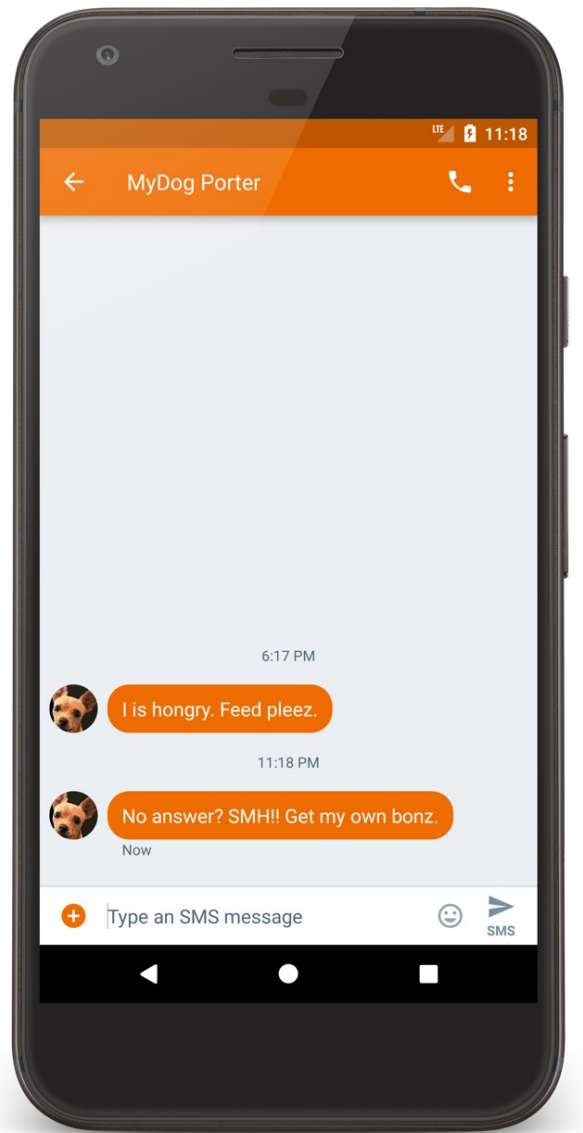

Manage all of your conversations in one place

Find friends and start conversations with ease

Chat with friends in groups

Android Messages makes it easy to communicate with anyone by using SMS, MMS, and more. Stay in touch with friends and family, send group texts, and share your favorite pictures, videos, audio messages.

Key features:

ConversationActivity.java

```
package com.android.messaging.ui.conversation;
```

```
...
```

```
public class ConversationActivity extends BugleActionBarActivity  
    implements ContactPickerFragmentHost,  
        ConversationFragmentHost, ConversationActivityUiStateHost {
```

```
...
```

Android source code available at: <https://source.android.com>

Service

Runs in the background

to perform long-running operations

to support interaction with remote processes

MyDog Porter

LTE 11:18

6:17 PM

I is hongry. Feed pleez.

11:18 PM

No answer? SMH!! Get my own bonz.

Now

Type an SMS message

SMS

MmsService.java

```
package com.android.mms.service;
```

```
...
```

```
/**
```

```
 * System service to process MMS API requests
```

```
 */
```

```
public class MmsService extends Service implements  
MmsRequest.RequestManager {
```

```
...
```

BroadcastReceiver

Component that listens for and responds to events

Acts as the subscriber in publish/subscribe pattern

BroadcastReceiver

Events are represented by an Intent and then broadcast by the platform

BroadcastReceivers can receive and respond to to broadcast events

SmsDeliverReceiver.java

```
package com.android.messaging.receiver;

...
/**
 * Class that receives incoming SMS messages on KLP+ Devices.
 */
public final class SmsDeliverReceiver extends BroadcastReceiver {
    @Override
    public void onReceive(final Context context, final Intent intent) {
        SmsReceiver.deliverSmsIntent(context, intent);
    }
}
```

Content Providers

Store & share data across applications

Uses database-style interface

Handles interprocess communication

SuggestionsProvider.java

```
package com.android.mms;
```

```
...
```

```
/**
```

```
 * Suggestions provider for mms.
```

```
 * Queries the "words" table to provide possible word suggestions.
```

```
 */
```

```
public class SuggestionsProvider extends android.content.ContentProvider {
```

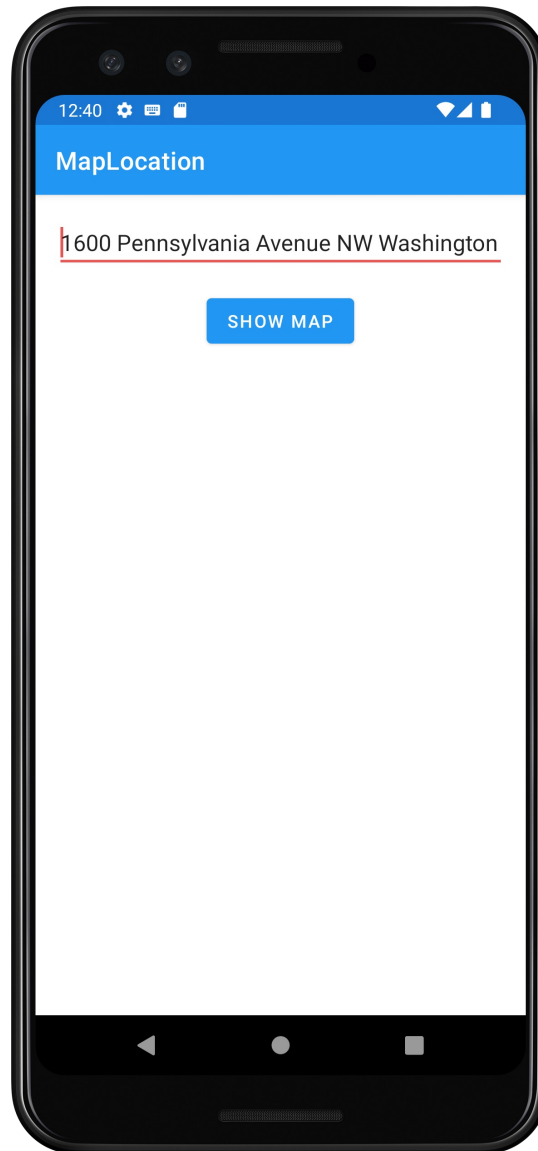

```
...
```

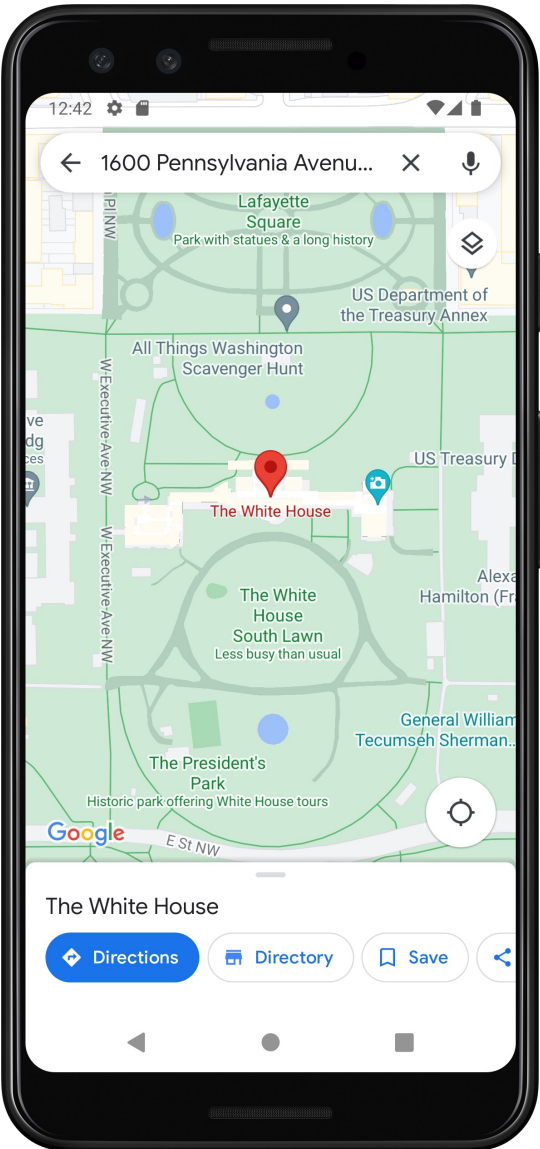

MapLocation

User enters an address

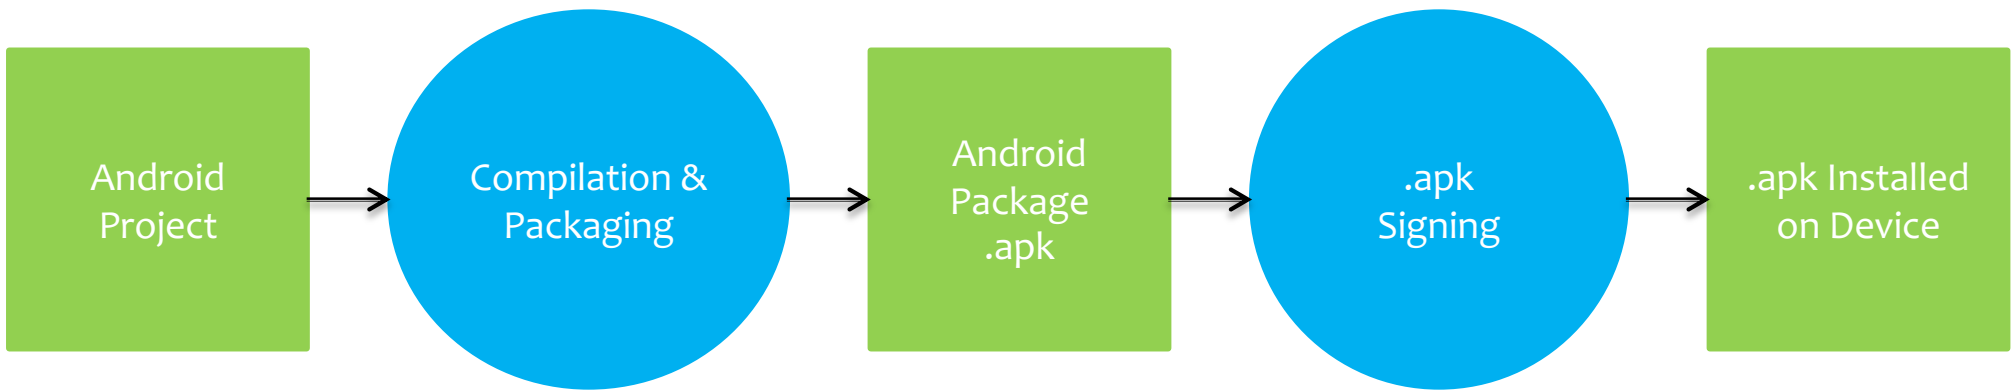

App displays a map of area around the address

MapLocation

Simplified App Development Workflow

Creating an Android App

Define resources

Implement application classes

Package application

Install & run application

1. Defining Resources

Resources are non-source code entities

Many different resource types, e.g.,

Layout, strings, images, menus, & animations

Allows apps to be customized for different devices and users

See: <https://developer.android.com/guide/topics/resources/overview.html>

Strings

Types: String, String Array, Plurals

Strings

Types: String, String Array, Plurals

Typically stored in res/values/*.xml

Specified in XML, e.g.,

```
<string name="hello">Hello World!</string>
```

Can include formatting and styling codes

Strings

Accessed by other resources as:

`@string/string_name`

Accessed in Kotlin as:

`R.string.string_name`

MapLocation's Strings Files

values/strings.xml

```
<resources>  
  <string name="show_map_string">Show Map</string>  
  <string name="location_string">Enter Location</string>  
</resources>
```

values-it/strings.xml

```
<resources>  
  <string name="show_map_string">Mostra la mappa</string>  
  <string name="location_string">Digita l'indirizzo</string>  
</resources>
```

Customized Strings at Runtime

If your default language is Italian,
`@string/location_string` is

“Digita l’indirizzo”

Otherwise, it’s,

“Enter Location”

User Interface Layout

UI layout specified in XML files

Some tools allow visual layout

XML files typically stored in `res/layout/*.xml`

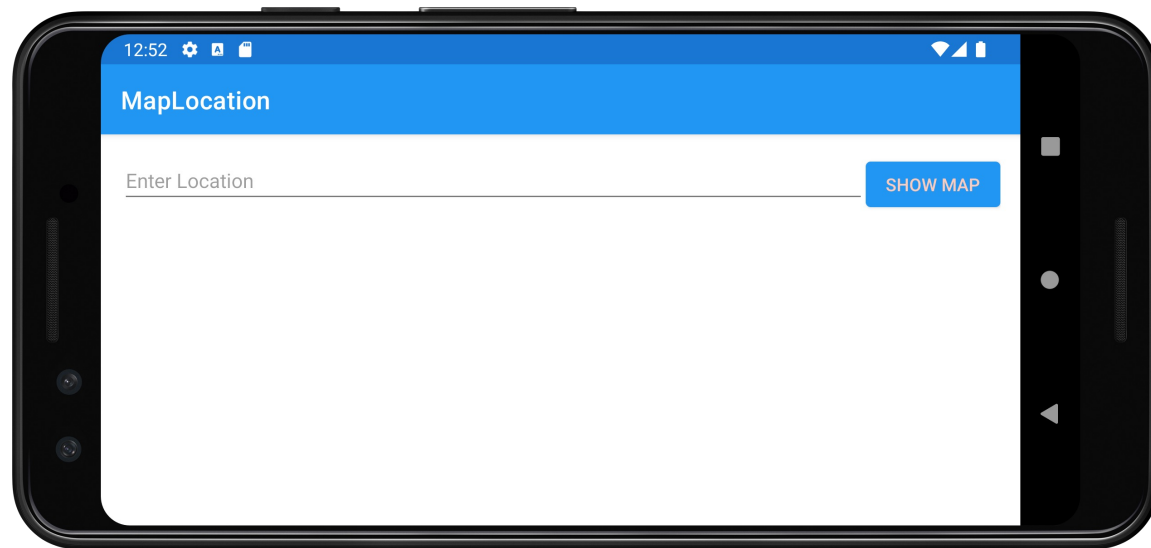

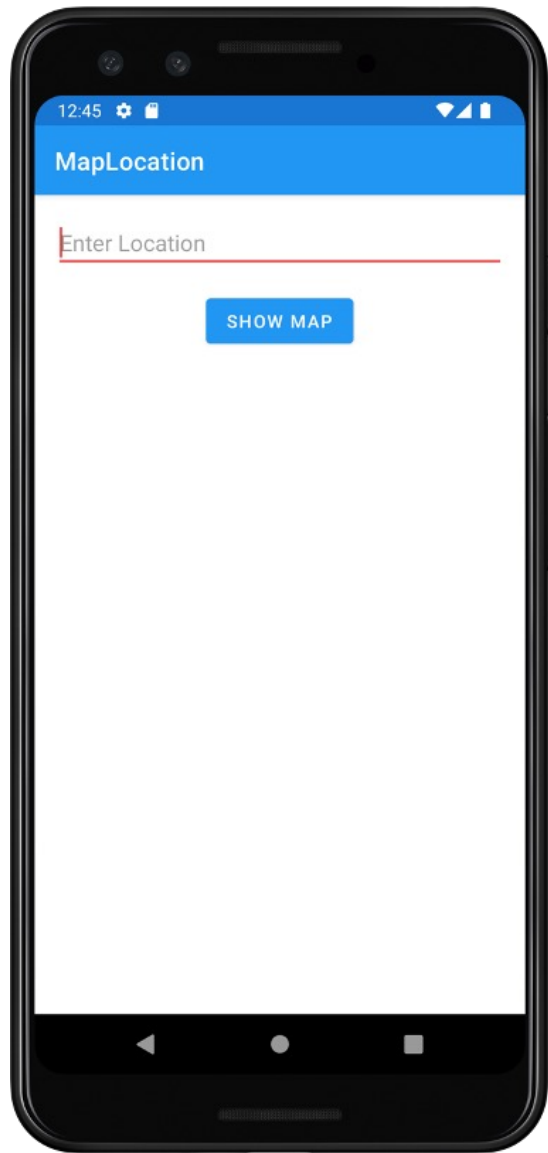

Accessed in Kotlin as `R.layout.layout_name`

Accessed by other resources as:

`@layout/layout_name`

Using Multiple Layout Files

Can specify different layout files based on your device's orientation, screen size, etc.

R Class

At compilation time, resources are used to generate the R class

App code uses the R class to access resources

R class is generated directly into bytecode

R.Java (Simulated Example)

```
package course.examples.maplocation;

public final class R {
    public static final class color {
        public static final int accent=0x7f010000;
        public static final int edit_text=0x7f010001;
        public static final int primary=0x7f010002;
        public static final int primary_dark=0x7f010003;
        public static final int primary_light=0x7f010004;
        public static final int primary_text=0x7f010005;
        public static final int secondary_text=0x7f010006;
    }
}
```

R.Java (Simulated Example)

```
public static final class dimen {  
    public static final int activity_margin=0x7f020000;  
}  
public static final class id {  
    public static final int location=0x7f030000;  
    public static final int mapButton=0x7f030001;  
}  
public static final class layout {  
    public static final int main=0x7f040000;  
}  
public static final class mipmap {  
    public static final int ic_launcher=0x7f050000;  
}
```

R.Java (Simulated Example)

```
public static final class string {  
    public static final int location_string=0x7f060000;  
    public static final int show_map_string=0x7f060001;  
}  
public static final class style {  
    public static final int MaterialTheme=0x7f070000;  
}  
}
```

2. Implement Classes

Usually involves at least one Activity

Activity initialization code usually in onCreate()

2. Implement Classes

Typical onCreate() workflow

Restore saved state, if necessary

Set content view

Initialize UI elements

Link UI elements to code actions

Notes on View Binding

View binding allows code to easily interact with views.

If enabled, view binding generates a *binding class* for each XML layout file

Binding class contains direct references to all views that have an ID in the corresponding layout

view binding replaces `findViewById()`

Review MapLocation.kt

Open MapLocation.kt

Review with at least one other student

Which of the typical workflow steps are represented in that code?

Where are those steps implemented in the code?

3. Package Application

System packages application components & resources into a .apk file

Developers specify required application information in a file called AndroidManifest.xml

AndroidManifest.xml

Information includes:

Application name

Application components

Other

- Required permissions

- Application features

- etc.

4. Install & Run

From IDE run app in the emulator or device

From command line

Enable USB Debugging on the device

See: <https://developer.android.com/studio/debug/dev-options.html>

```
%adb install <path_to_apk>
```

Next

The Activity Class

Example Applications
