CMSC436: Programming Handheld Systems

The Android Platform

The Android Platform

A software stack for mobile devices:

OS kernel and interfaces, system libraries, frameworks & key apps

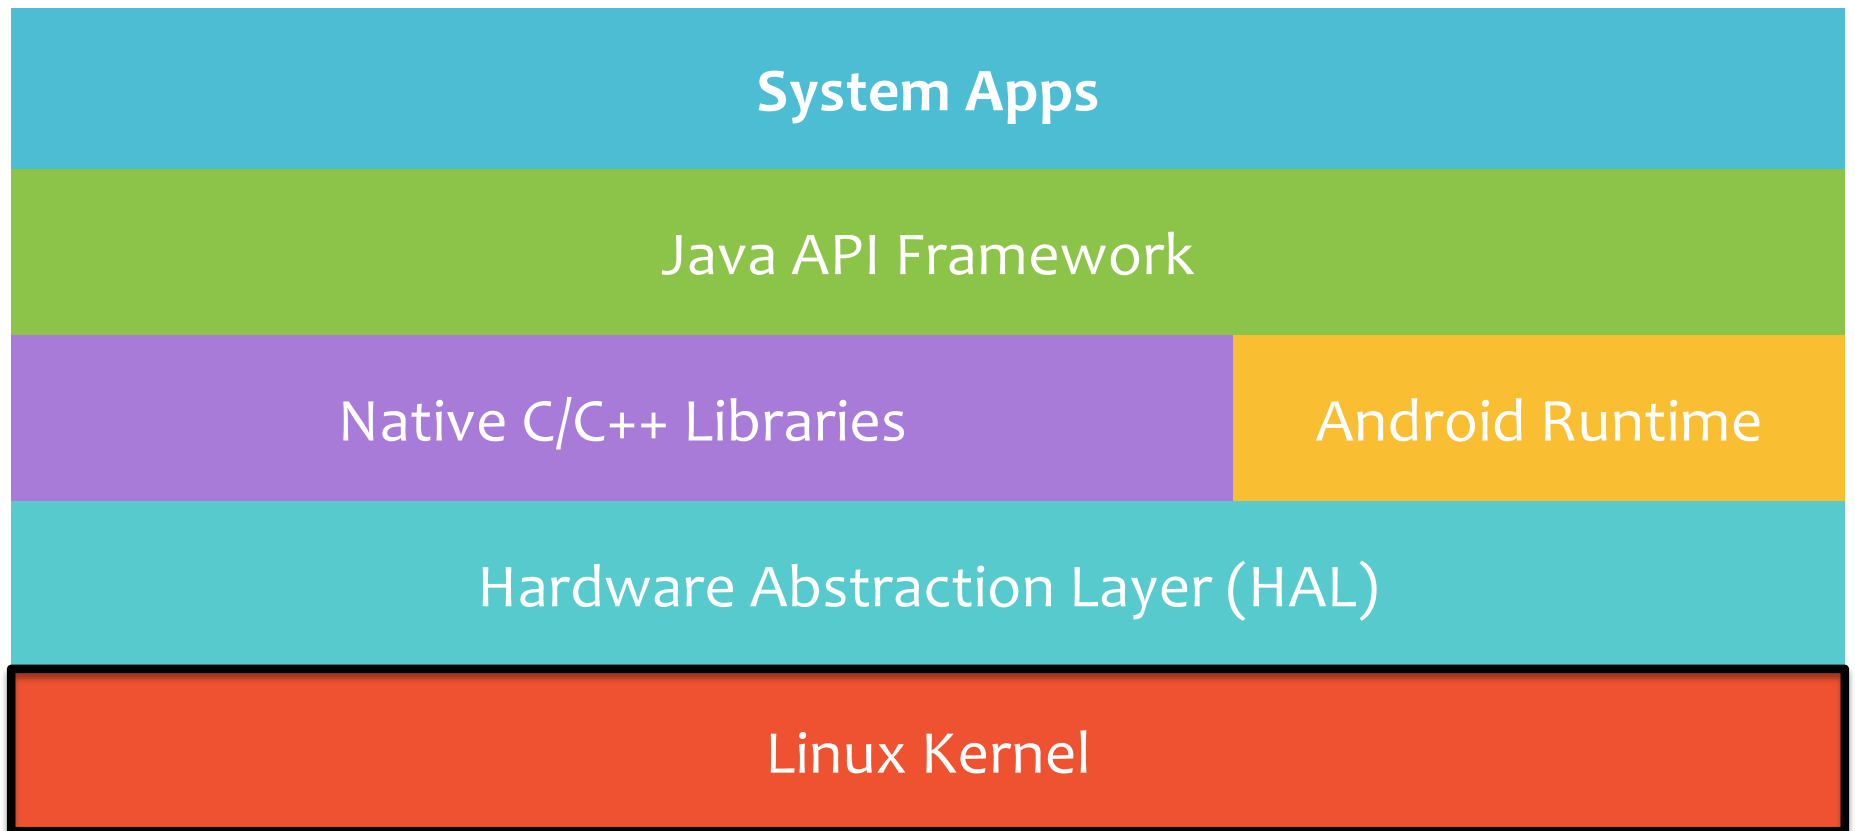

Android SDK for creating apps

Libraries & development tools

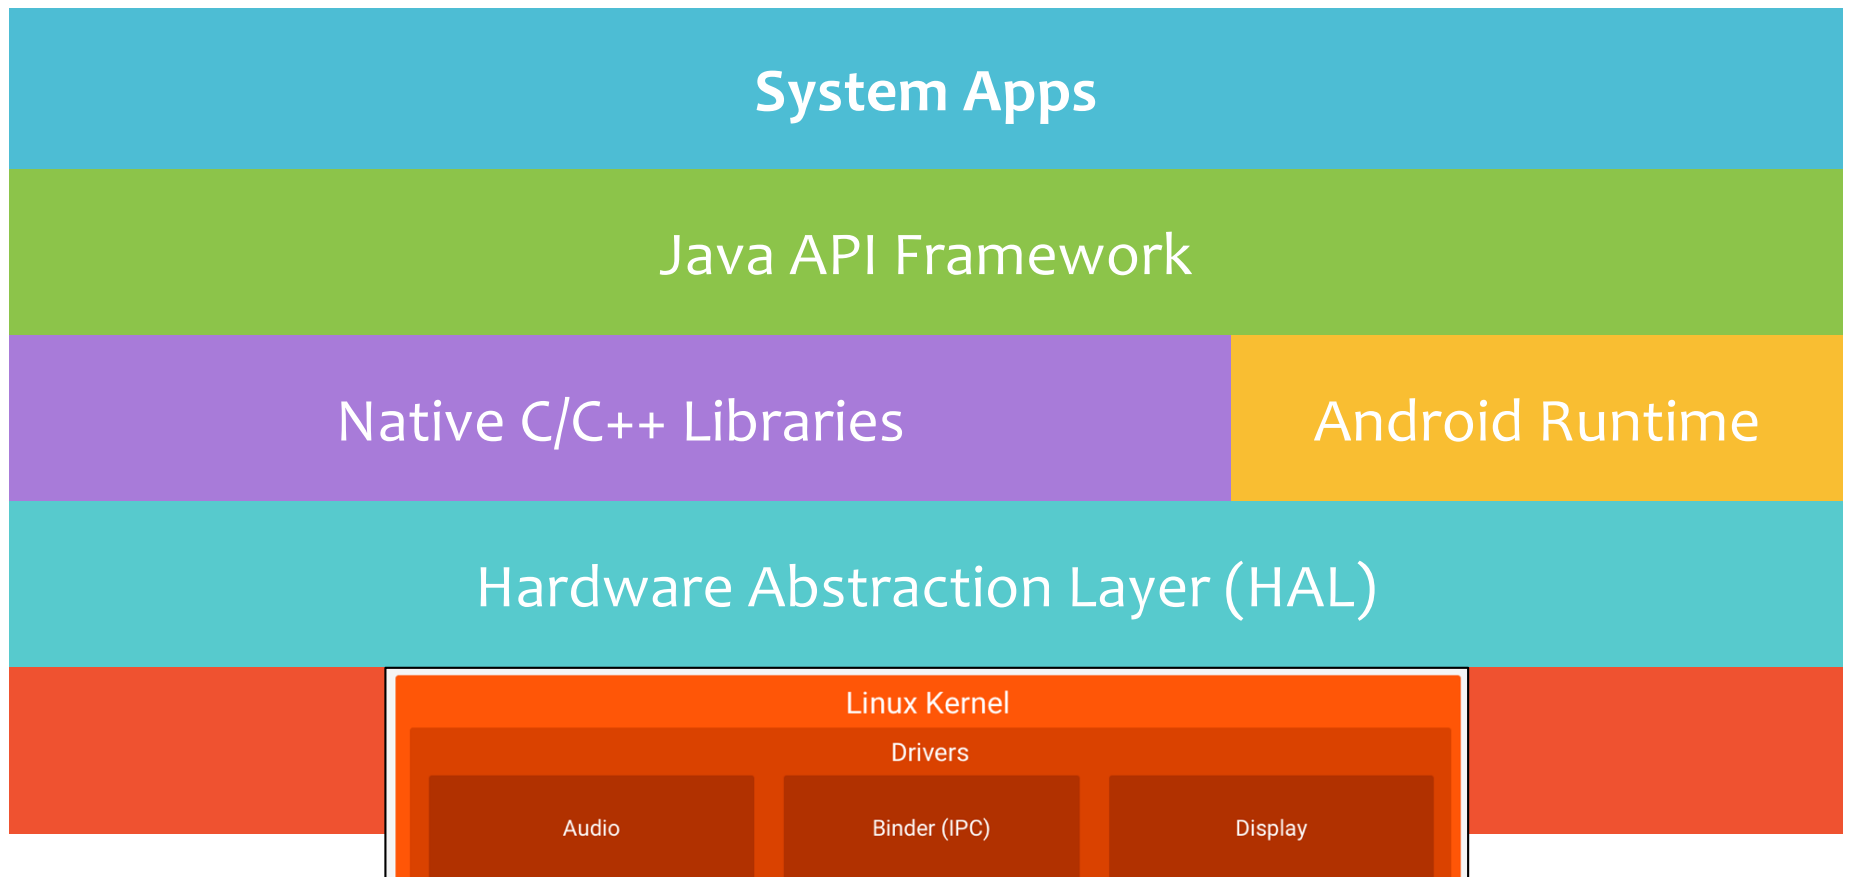

Lots of documentation. Start browsing today!

See: <https://developer.android.com/training>

The Android Architecture

The Android Architecture

Linux Kernel – Standard Services

Security

Memory & process management

File & network I/O

Device drivers

Linux Kernel - Android-Specific

Power management

Low memory killer

Interprocess communication (IPC)

The Android Architecture

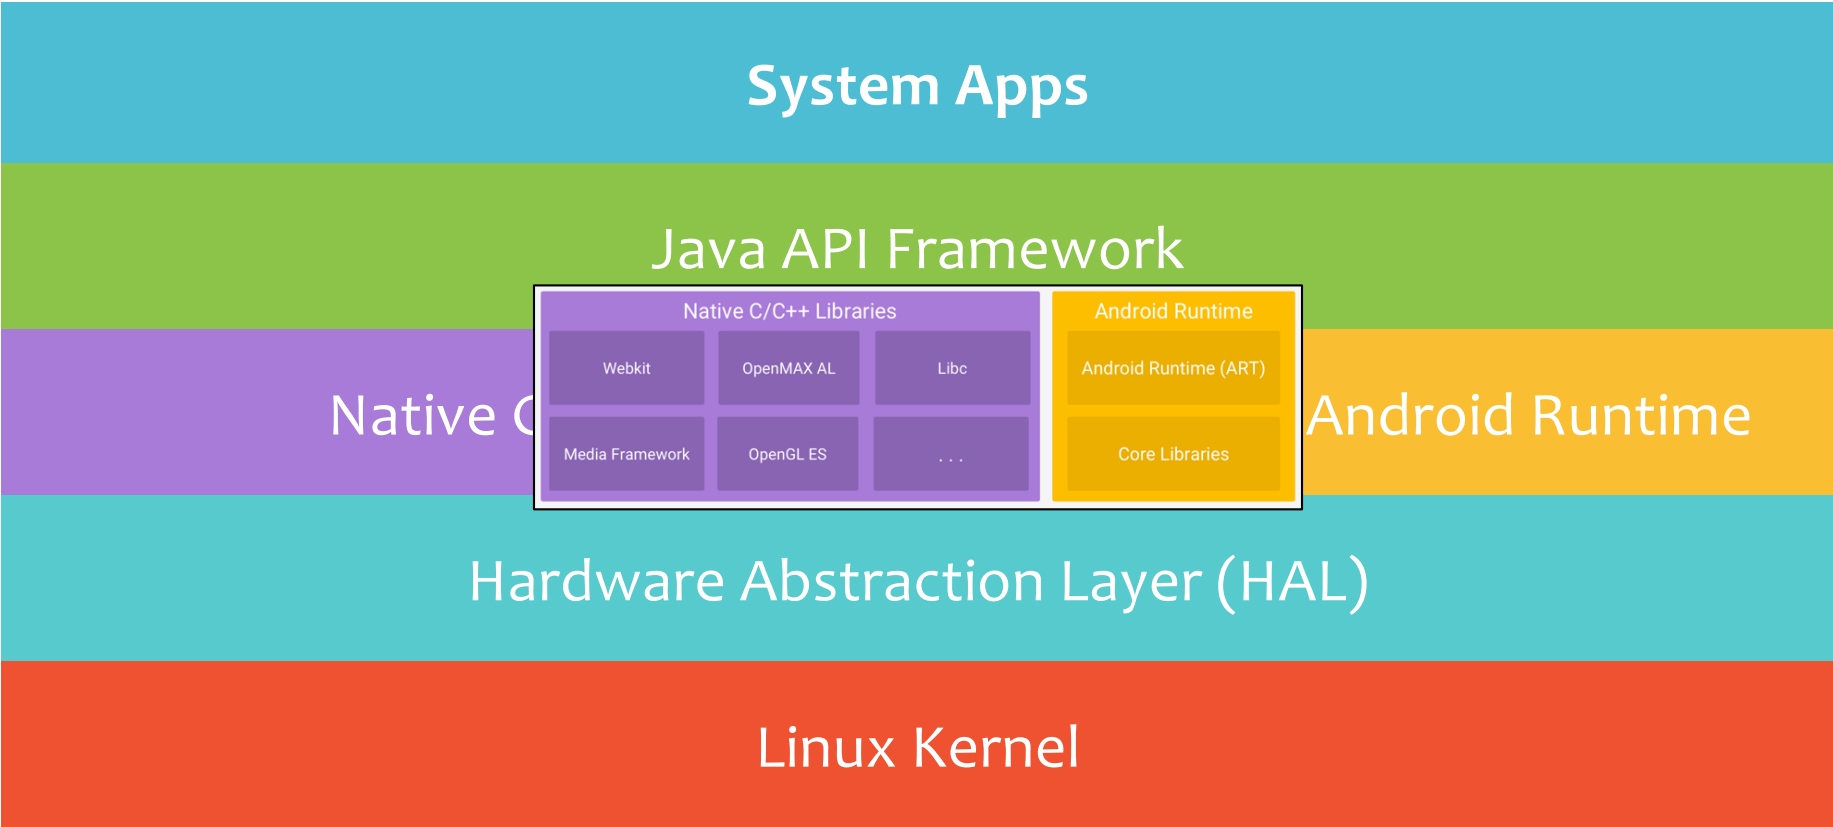

Hardware Abstraction Layer (HAL)

Provides standard interfaces between API framework and device hardware

Defines and interface for various hardware classes, such as Camera, Audio, Sensors, etc.

Android loads library modules for hardware components on demand

The Android Architecture

Libraries

Bionic libc

Surface Manager

Media Framework

FreeType

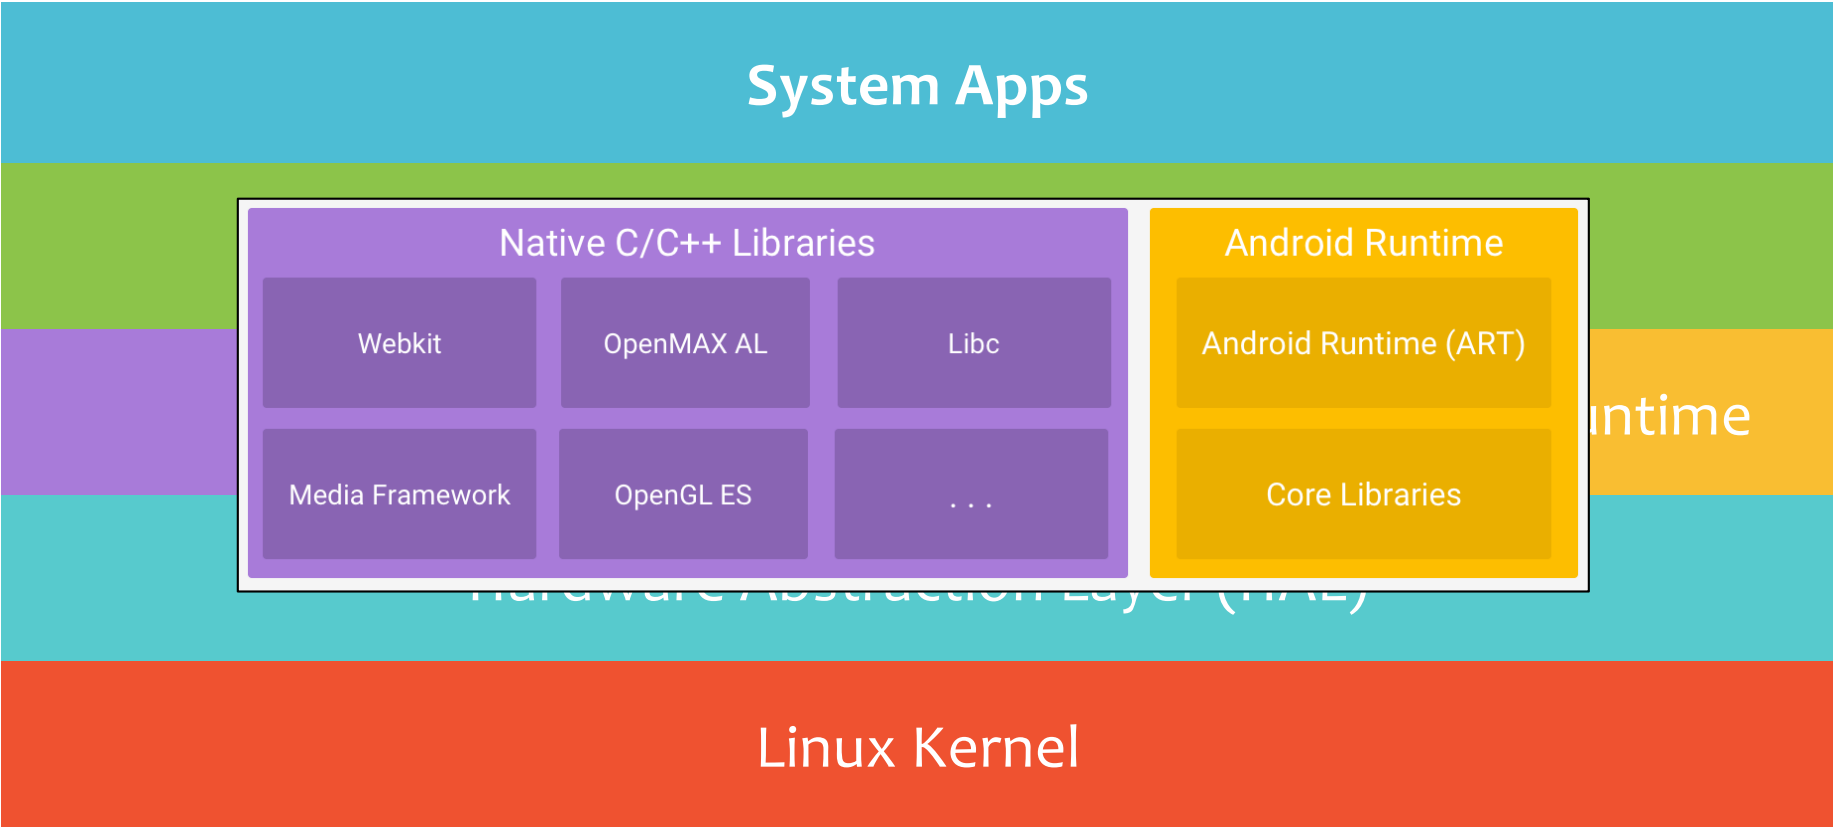

Webkit

OpenGL

SQLite

SSL

The Android Architecture

Android Runtime

Two main components

Core Java libraries with some Java 8+ feature support

Android Runtime (ART)

Core Java Libraries

Basic java classes -- java.*, javax.*

App lifecycle, basic services -- android.*, androidx

Internet/Web services -- org. *

Unit testing -- junit.*

Java 8+ support

Android does not support all Java 8+ language features

Some supported features (in API level 24 or higher)

- Lambda expressions

- Method references

- `java.util.function` and `java.util.stream`

See: <https://developer.android.com/studio/write/java8-support>

Android Runtime (ART)

Since Android 5.0, apps are executed in a managed runtime environment (ART)

On older platforms, apps run in the Dalvik Virtual Machine

ART Design Goals

Designed for resource-constrained environments

Slower CPU

Less RAM

Limited battery life

Major ART Features

Ahead-of-time (AOT) and just-in-time (JIT) compilation

Optimized garbage collection (GC)

API level 28+ conversion of an app package's Dalvik Executable format (DEX) files to more compact machine code

Better debugging support, including a dedicated sampling profiler, detailed diagnostic exceptions and crash reporting, and the ability to set watchpoints to monitor specific fields

Notional Workflow

App written in Java, Kotlin or C++

Compiled to Java bytecode files

Tool chain converts java bytecode files to a single dex-formatted bytecode file

Bytecodes (and other resources) installed on device

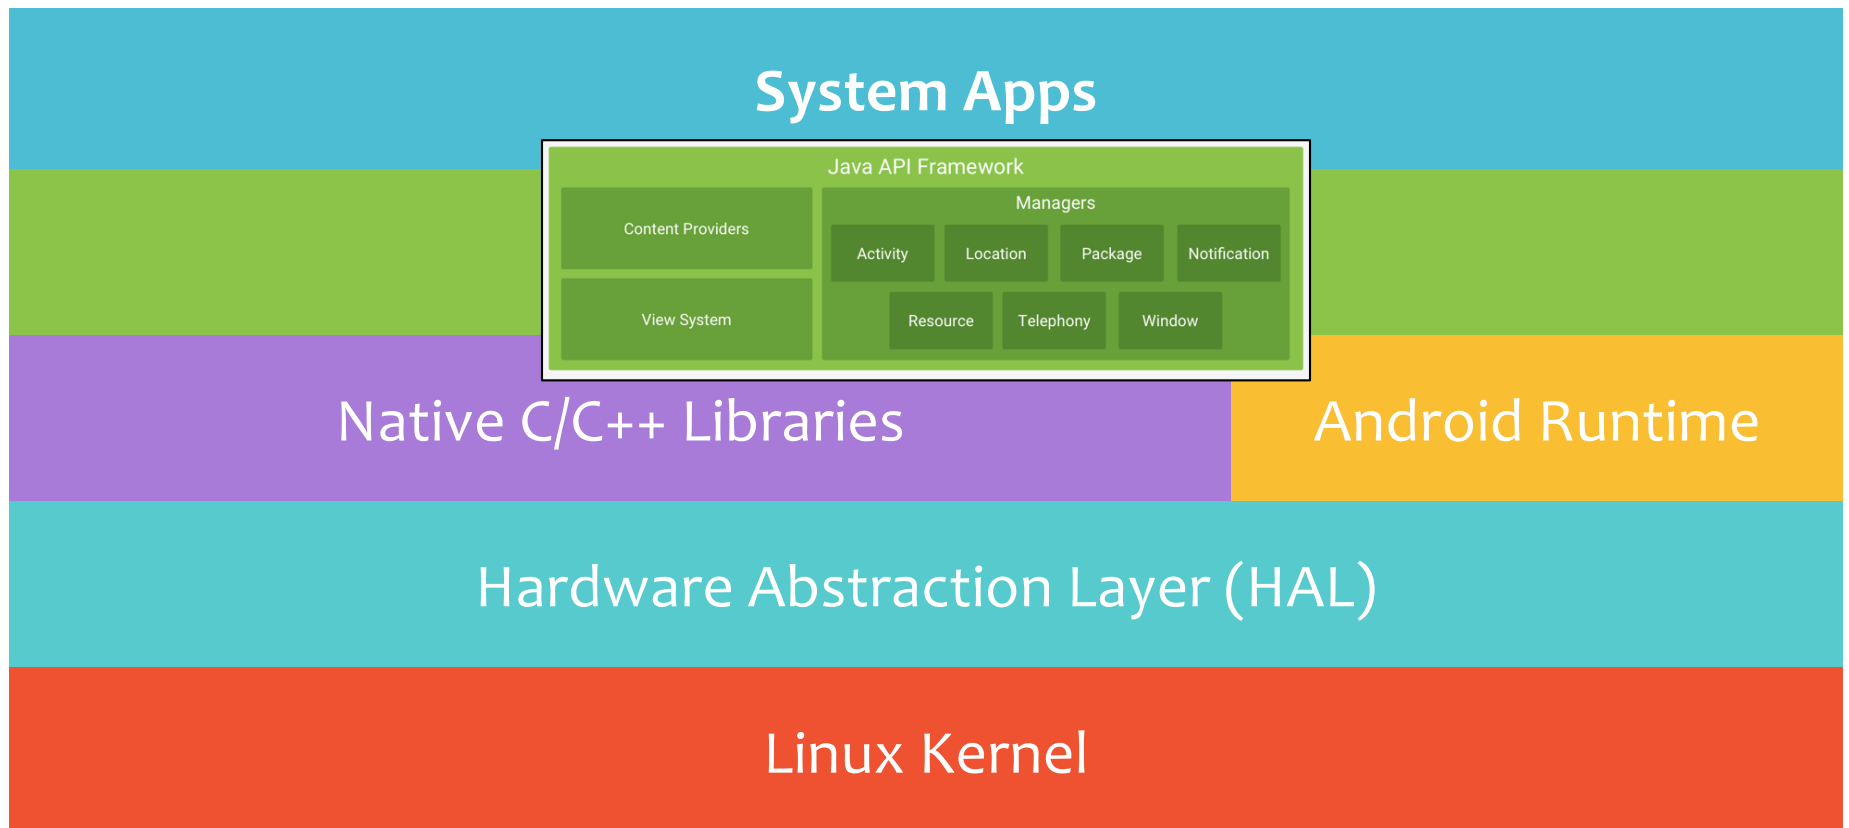

ART

Compiles dex bytecode to native binary for improved runtime performance

Applies system-dependent optimizations at installation time, runtime, and in background

Results in faster execution at cost of larger executable

The Android Architecture

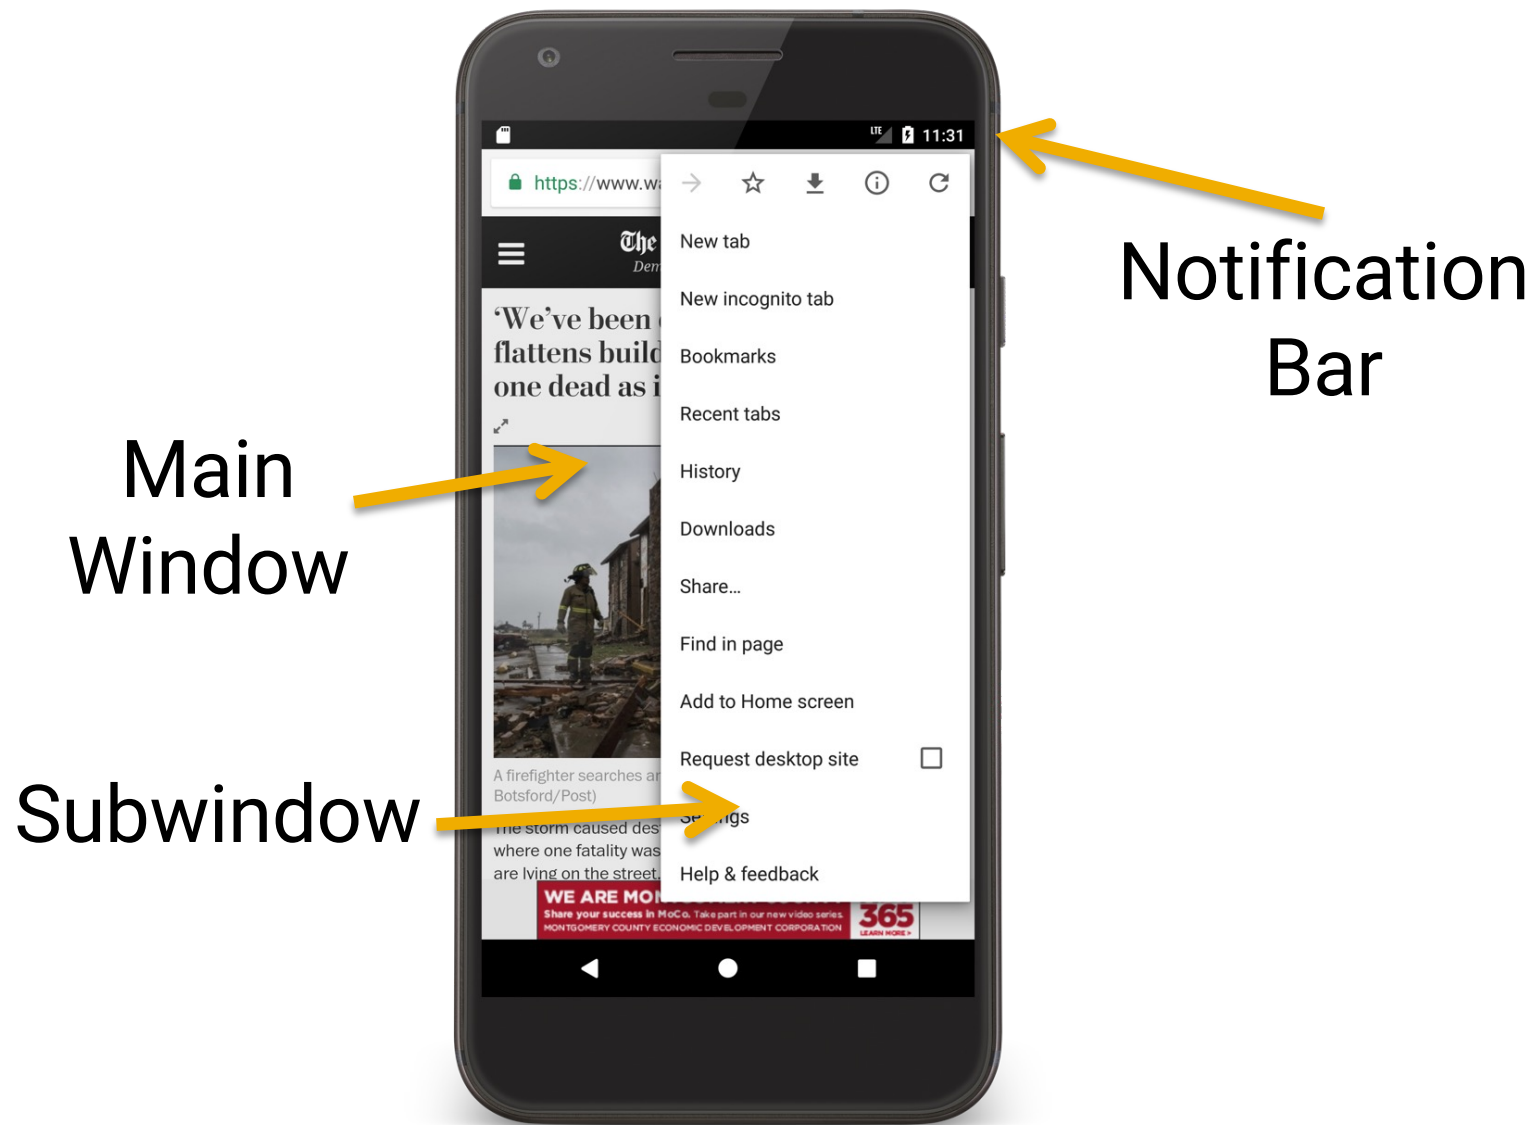

Package Manager

Keeps track of app packages on device

Window Manager

Manages the windows comprising an app

View System

Provides common user interface elements

e.g., icons, text entry boxes, buttons and more

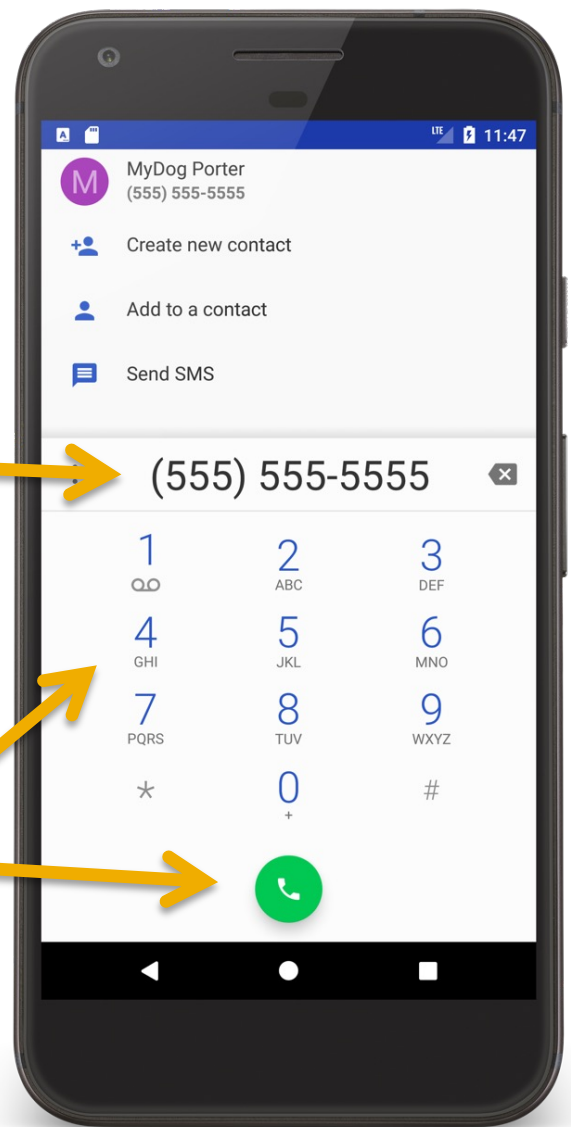

Tabs

TextView

Buttons

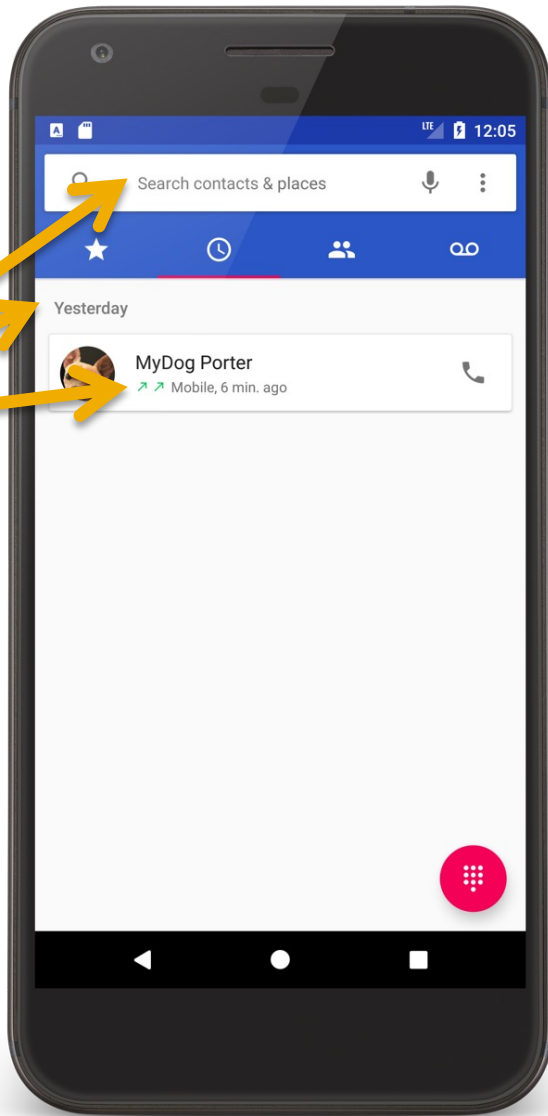

Resource Manager

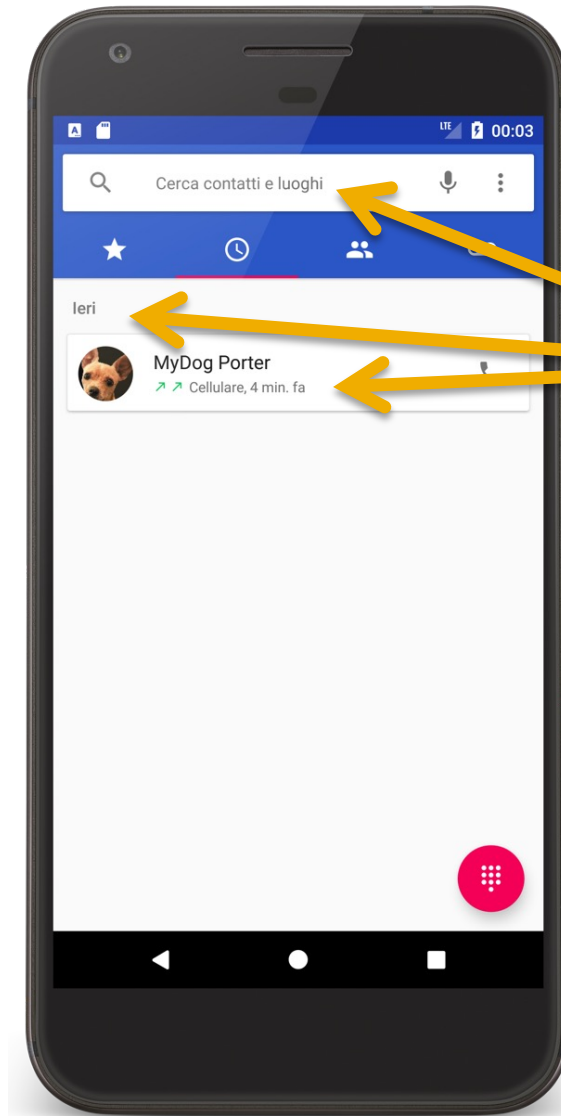

Manages non-compiled resources

e.g., strings, graphics, & layout files

English
Strings

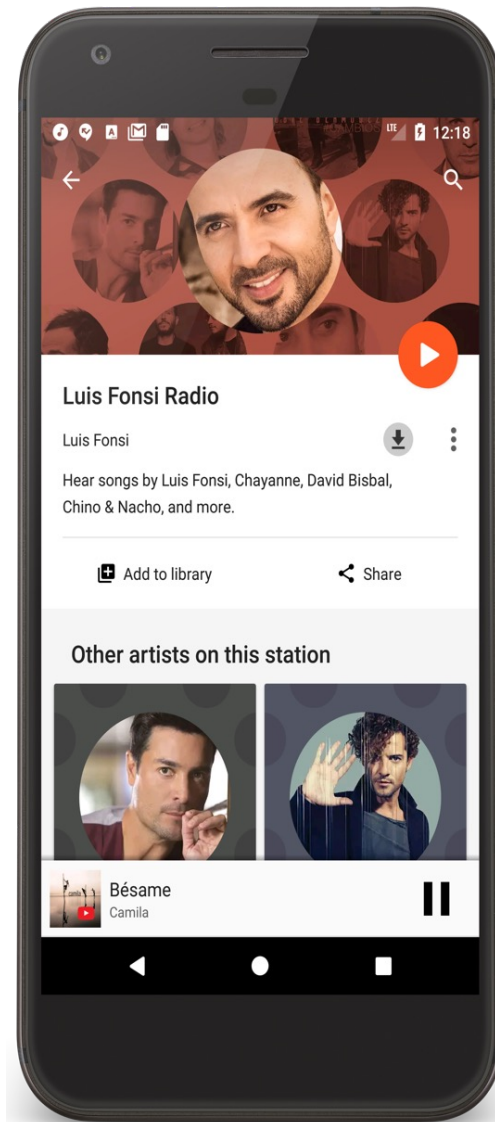

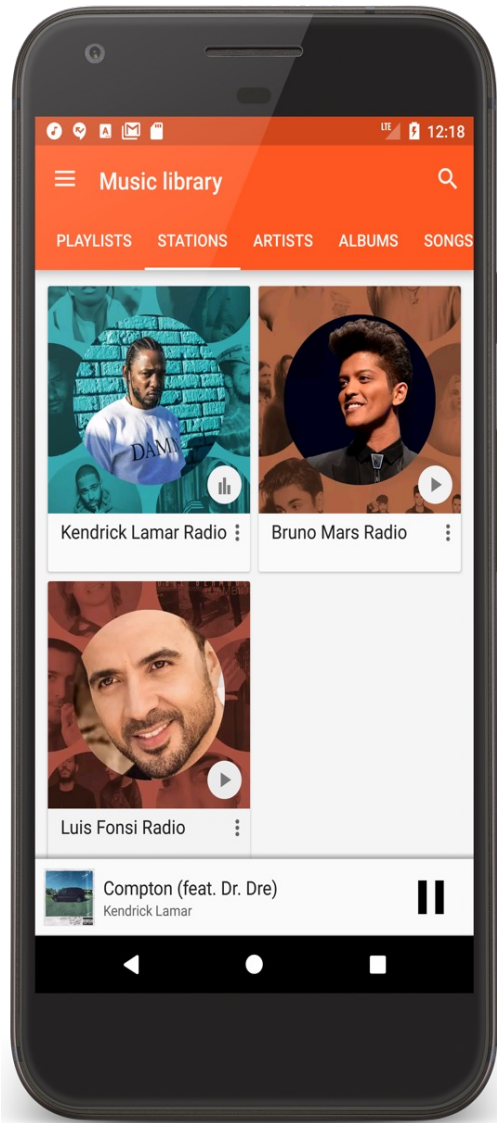

Italian
Strings

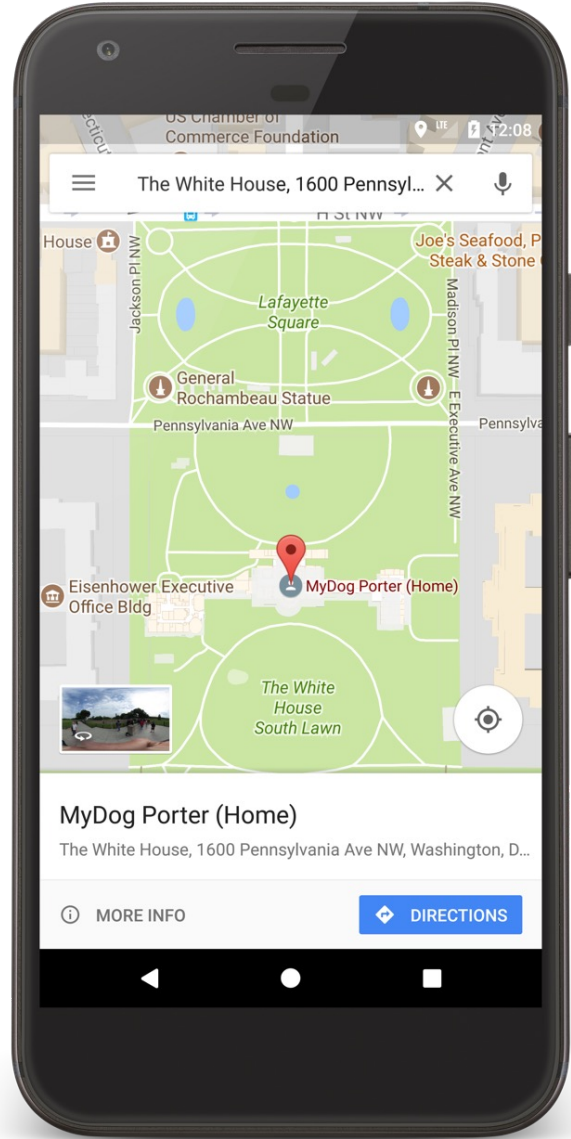

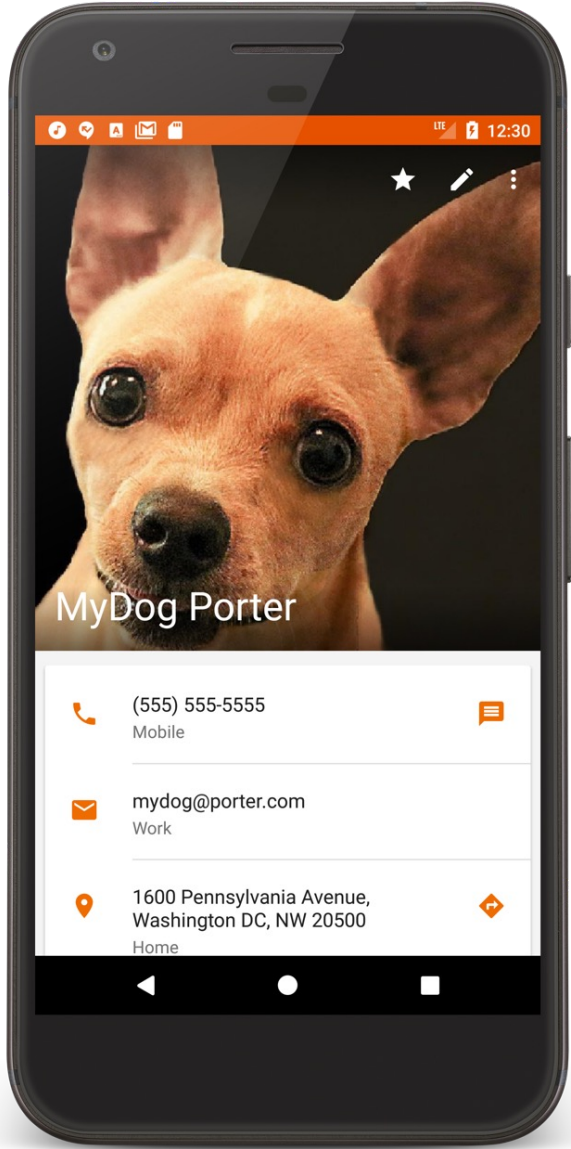

Activity Manager

Manages app lifecycle and navigation stack

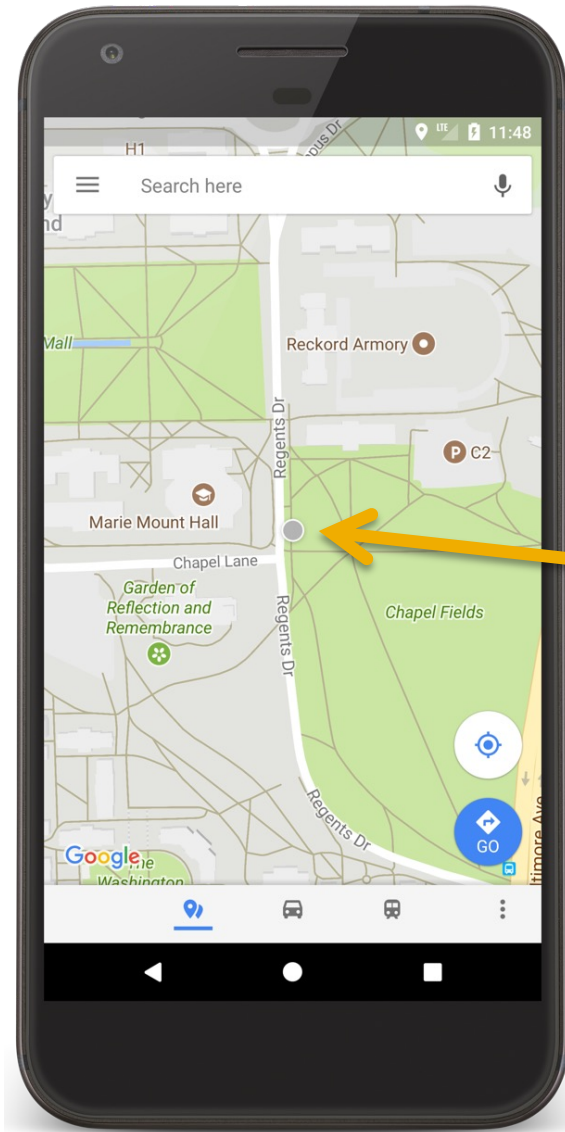

ContentProvider

Inter-application data sharing

Location Manager

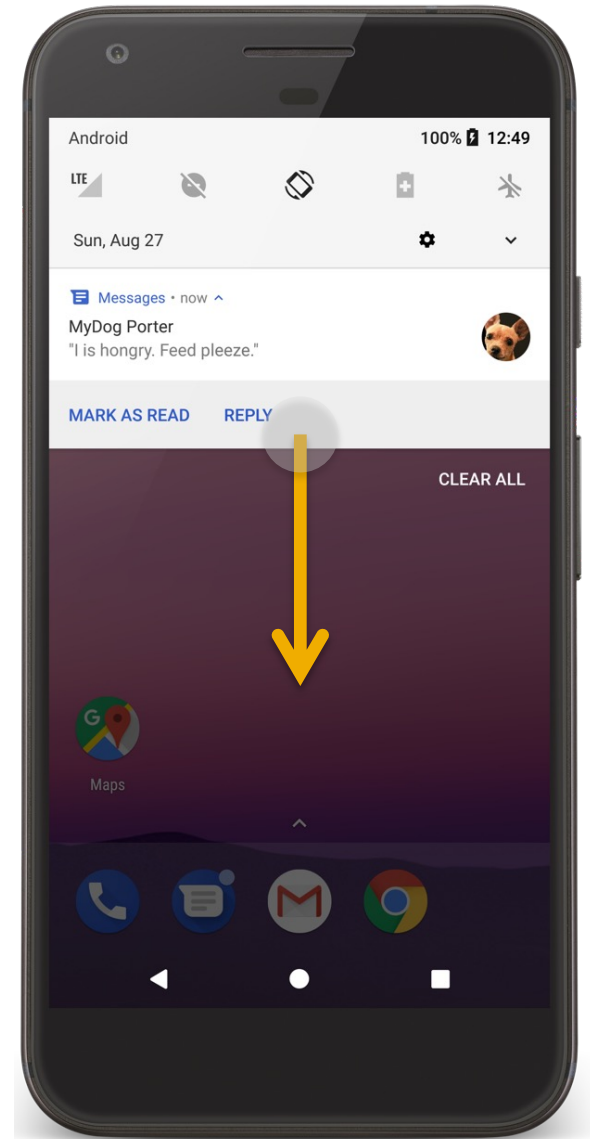

Provides location & movement information

User's
Location

Notification Manager

Place notification icons in the status bar area when important events occur

The Android Architecture

Applications

Standard apps include:

Home – main screen

Contacts – contacts database

Phone – dial phone numbers

Browser – view web pages

Email reader – compose & read email messages

Applications

Nothing special about these apps

You can substitute your own or 3rd party app for any of them
