

Lecture Set 2: Starting Java

1. Java Concepts
2. Java Programming Basics
3. User output
4. Variables and types
5. Expressions
6. User input

CMSC 131 Spring 2008
Jan Plane (adapted from Bonnie Dorr)

This Course: Intro to Procedural Programming using Java

Why Java?

- Popular modern language
- Used in web, business, telecom applications
- Developed in 1990s, incorporates many features from earlier languages
 - *Object-orientation*
 - *Garbage collection*
 - *Portability of object code*

CMSC 131 Spring 2008
Jan Plane (adapted from Bonnie Dorr)

1

Portability of Object Code?

- Object code is 2GL (assembly) / 1GL (machine code)
- Last time we said that 2GL / 1GL is architecture-specific
- How can Java have portable object code?
Answer: *Java Virtual Machine (JVM)*

CMSC 131 Spring 2008
Jan Plane (adapted from Bonnie Dorr)

2

Java Virtual Machine

- Java includes definition of *Java bytecode* = “fake” machine code for Java
- Java compilers produce Java bytecode
- To run Java bytecode, must have bytecode interpreter (“Java Virtual Machine”) on client machine

3

Facts about JVMs

- For efficiency, JVMs often compile bytecode into native machine code
- There are also “native” Java compilers (these compile Java directly to machine code)

CMSC 131 Spring 2008
Jan Pläne (adapted from Bonnie Dorr)

4

Method Headers

- **main** is a method = “operation”
 - Operations require operands = data to work on
 - Operations return new data (result)
 - Header gives information on form of operands, result for methods
- For main:
 - Operand is collection of Strings
 - Result is “void” (= unimportant)
 - More later on “public”, “static”
- **Every program must have exactly one “main” method** (where execution begins)

CMSC 131 Spring 2008
Jan Pläne (adapted from Bonnie Dorr)

5

Output and Comments

- Output to console
 - System.out.println
 - System.out.print
 - String Literals always use "quotation marks"
- Comments: explanations added by programmer
 - ignored by the compiler
 - read by other people looking at the code
 - Two styles
 - /* ... */
 - // to end of line...
 - Comments are essential for good programming!

CMSC 131 Spring 2008
Jan Plane (adapted from Bonnie Dorri)

6

Objects

- Bundles of data ("instance variables") and methods ("functions")
- Created using classes as "templates"
- We'll learn more later this semester

CMSC 131 Spring 2008
Jan Plane (adapted from Bonnie Dorri)

7

Java Program Organization

- Class
 - Structure around which all Java programs are based
 - A typical Java program consists of many classes
 - Each class resides in its own file, whose name is based on the class's name
 - The class is delimited by curly braces { ... }.

File name: **Example1.java**:

```
public class Example1a {  
    ... (contents of the class go here) ...  
}
```

A class consist of data (**variables**) and operations (**methods**)

CMSC 131 Spring 2008
Jan Plane (adapted from Bonnie Dorri)

8

example1b

- variables
 - declaration
 - initialization
 - assignment
 - value use
- mathematical expressions
 - calculated to take on a value
 - based on values of literals and variables

CMSC 131 Spring 2008
Jan Plane (adapted from Bonnie Dorri)

9

Java Program Organization

- Methods
 - Where most computation takes place
 - Each method has a name, a list of arguments enclosed in (...), and body (collection of *statements*) in {...}
- ```
public static void main(String[] args) {
 ... (contents of the main method go here) ...
}
```
- Variables
    - Storage locations that program can operate on
    - Variables can store data of different forms (integers, for example)

```
int secondsPerMinute = 60;
int minutesPerLecture = 50;
```

CMSC 131 Spring 2008  
Jan Plane (adapted from Bonnie Dorri)

10

---

---

---

---

---

---

---

---

## Java Program Organization

- Statements: Many different types
  - Declarations – specify variable types (and optionally initialize)  

```
int x, y, z; // three integer variables
String s = "Howdy"; // a character string variable
boolean isValid = true; // a boolean (true/false) variable
```
  - Assignments – assign variables new values  

```
x = 13;
```
  - Method invocation – call other methods  

```
System.out.println("Print this message");
```
  - Control flow – determine the order of statement execution.  
(These include **if-then-else**, **while**, **do-while**, **for**. More later.)
- Built-in Operators: For manipulating values (+, -, \*, /, etc.)
  - I.e. String Concatenation for output

CMSC 131 Spring 2008  
Jan Plane (adapted from Bonnie Dorri)

## Built-in (Primitive) Types

|          | Type name | Size (bytes) |
|----------|-----------|--------------|
| Integers | byte      | 1            |
|          | short     | 2            |
|          | int       | 4            |
|          | long      | 8            |
| Reals    | float     | 4            |
|          | double    | 8            |
| Other    | char      | 2            |
|          | boolean   | 1            |

CMSC 131 Spring 2008  
Jan Plane (adapted from Bonnie Dorri)

12

---

---

---

---

---

---

---

---

## String Type

- Elements of String type are sequences of characters  
“abc” “Call me Ishmael” etc.
- String type is *not* built-in
- We will use it a lot
- Useful operation: *concatenation* (+)  
“abc” + “def” = “abcdef”

CMSC 131 Spring 2008  
Jan Plane (adapted from Bonnie Dorri)

13

---

---

---

---

---

---

---

---

## Writing Programs in Java

1. EXPRESSIONS: computations that carry a value
2. OPERATORS: symbols like +, \*, -, etc.
3. Statements end with a semicolon
4. Types of statements:
  - a) DECLARATION (where a variable is created)
  - b) ASSIGNMENT (where a variable is given a value)
  - c) METHOD INVOCATIONS (where another method is called)
  - d) others - later
5. You can put blank lines in anytime you want
6. Proper indenting helps readability

CMSC 131 Spring 2008  
Jan Plane (adapted from Bonnie Dorri)

14

---

---

---

---

---

---

---

---

## Variables ...

- ... are named storage locations

| Variable | Value |
|----------|-------|
| x        | 5     |

- Recall that memory is a sequence of bits
- Question: How much memory to allocate for a variable's value?
- Answer: A variable must have a *type* specifying how much storage to allocate.

CMSC 131 Spring 2008  
Jan Plane (adapted from Bonnie Dorri)

15

## Recall Java Built-in Types

|          | Type name | Size (bytes) |
|----------|-----------|--------------|
| Integers | byte      | 1            |
|          | short     | 2            |
|          | int       | 4            |
|          | long      | 8            |
| Reals    | float     | 4            |
|          | double    | 8            |
| Other    | char      | 2            |
|          | boolean   | 1            |

CMSC 131 Spring 2008

## Primitive Data Types In Detail

### Integer Types:

|       |         |                                         |
|-------|---------|-----------------------------------------|
| byte  | 1 byte  | Range: -128 to +127                     |
| short | 2 bytes | Range: -32,000 to +32,000               |
| int   | 4 bytes | Range: -2 billion to +2 billion         |
| long  | 8 bytes | Range: -9 quintillion to +9 quintillion |

### Floating-Point Types:

|        |         |                                                                       |
|--------|---------|-----------------------------------------------------------------------|
| float  | 4 bytes | -3.4x10 <sup>38</sup> to 3.4x10 <sup>38</sup> , 7 digits of precision |
| double | 8 bytes | -1.7x10 <sup>308</sup> to 1.7x10 <sup>308</sup> , 15 digits of prec.  |

### Other types:

|         |         |                              |
|---------|---------|------------------------------|
| boolean | 1 byte  | true, false                  |
| char    | 2 bytes | A single (Unicode) character |

CMSC 131 Spring 2008  
Jan Plane (adapted from Bonnie Dorri)

## Primitive-Type Constants

- Constants are also called **literals**
- Integer types:**
  - byte** } optional sign and digits (0-9): 12 -1 +234 0 1234567
  - short** }
  - int** }
  - long** } Same as above, but followed by 'L' or 'l': -1394382953L
- Floating-point types:**
  - double** Two allowable forms:
    - Decimal notation:** 3.14159 -234.421 0.0042 -43.0
    - Scientific notation:** (use E or e for base 10 exponent)
      - 3.145E5 =  $3.145 \times 10^5 = 314500.0$
      - 1834.23e-6 =  $1834.23 \times 10^{-6} = 0.00183423$
  - float** Same as double, but followed by 'f' or 'F': 3.14159F -43.2f

Avoid this lowercase L. It looks too much like the digit '1'

**Note:** By default, integer constants are **int**, unless 'L'/'l' is used to indicate they are **long**. Floating constants are **double**, unless 'F'/'f' is used to indicate they are **float**.

Jan Plane (adapted from Bonnie Dorri)

18

## Character and String Constants

- Char constants:** Single character in single quotes ('...') including:
  - Letters and digits:** 'A', 'B', 'C', ..., 'a', 'b', 'c', ..., '0', '1', ..., '9'
  - Punctuation symbols:** '!', '#', '@', '\$' (except ' and backslash '\')
  - Escape sequences:** (see below)
- String constants:** 0 or more characters in double quotes ("...")
- Escape sequences:** Allows inclusion of special characters:
  - `\"` double quote      `\n` new-line character (start a new line)
  - `\'` single quote      `\t` tab character
  - `\\` backslash
- Examples:** `char x = '\';` → (x contains a single quote)  
`String s1 = "Hi there!\\";` → s1 contains "Hi there!"  
`String s2 = "C:\\WINDOWS\";` → s2 contains C:\WINDOWS

CMS131 Spring 2008  
Jan Plane (adapted from Bonnie Dorri)

19

## Common Numeric Operators

- Arithmetic operators:**
  - Unary negation:** `-x`
  - Addition/subtraction:** `x+y` `x-y`
  - Multiplication/division:** `x*y` `x/y`
    - Division between integer types **truncates** to integer: `23/4` → 5
    - `x%y` returns the **remainder** of x divided by y: `23%4` → 3
    - Division with real types yields a real result: `23.0/4.0` → 5.75
- Comparison operators:**
  - Equality/inequality:** `x == y` `x != y`
  - Less than/greater than:** `x < y` `x > y`
  - Less than or equal/greater than or equal:** `x <= y` `x >= y`

These comparison operators return a **boolean** value: **true** or **false**.

CMS131 Spring 2008  
Jan Plane (adapted from Bonnie Dorri)

20

## Common String Operators

- **String Concatenation:** The '+' operator **concatenates** (joins) two strings.
  - "Go" + "Terps" → "GoTerps"  
Note: Concatenation does not add any space
  - When a string is concatenated with another type, the other type is first evaluated and **converted** into its string representation.  
 $(8+4) + \text{"degrees"} \rightarrow \text{"32degrees"}$        $(1 + 2) + \text{"5"} \rightarrow \text{"35"}$

- **String Comparison:** Strings have special comparison functions.
  - **s.equals(t)** : returns true if s and t have the same characters.
  - **s.compareTo(t)** : compares strings **lexicographically** (dictionary order)
    - result < 0      if s precedes t
    - result == 0      if s is equal to t
    - result > 0      if s follows t

"dilibert".compareTo( "dogbert" )      → -1 (which is < 0)

Both functions are case-sensitive.

CMSC 131 Spring 2008  
Jan Plane (adapted from Bonnie Dorr)

21

## User Input in Java

- We've done output (System.out); what about input?
- Java 5.0 includes the **Scanner class** feature
  - Can use Scanner to create "scanner objects"
  - Scanner objects convert user input into data
- To use Scanner need to *import* a library:  
`import java.util.Scanner;`

CMSC 131 Spring 2008  
Jan Plane (adapted from Bonnie Dorr)

22

## Example5.java

```
import java.util.Scanner;

public class Example5 {
 public static void main(String[] args) {
 int i;
 double d;
 String s;

 Scanner sc = new Scanner(System.in);

 System.out.print("Enter an integer: ");
 i = sc.nextInt();

 System.out.print("Enter a floating point value: ");
 d = sc.nextDouble();

 System.out.print("Enter a string: ");
 s = sc.next();

 System.out.println("Here is what you entered: ");
 System.out.println(i);
 System.out.println(d);
 System.out.println(s);
 }
}
```

Include the definition of the Scanner utility

Create new scanner object to read from keyboard

Input an integer

Input a double

Input a string (up to white space)

CMSC 131 Spring 2008  
Jan Plane (adapted from Bonnie Dorr)

23

## Scanner Class Details

- To create a scanner object:
  - `new Scanner(input_source);`
  - Input source can be keyboard (`System.in`), files, etc.
  - Object must be assigned to a variable (e.g. `sc`)
- Operations
  - `nextBoolean()`
  - `nextByte()`
  - `nextDouble()`
  - `nextFloat()`
  - `nextInt()`
  - `nextLong()`
  - `nextShort()`
  - `next()`
  - `nextLine()`

Returns value of indicated type (reports error if type mismatch)

Returns sequence of characters up to next whitespace (space, carriage return, tab, etc.)

Returns sequence of characters up to next carriage return

CMSC 131 Spring 2008  
Jan Plane (adapted from Bonnie Dorr)

24

## Objects

- From Example 5:
  - `Scanner sc = new Scanner(System.in);`
  - `sc` is a variable
  - Its type is `Scanner`
- What's going on?
  - `Scanner` is a class defined in `java.util.Scanner`
  - `System.in` is a predefined *object* for keyboard input
  - `new Scanner(System.in)` creates a new *object* in the `Scanner` class and assigns it to `sc`
- Object?
  - A bundle of data (*instance variables*) and operations (*methods*)
  - A class defines both instance variables and methods for objects
  - A class is also a type for objects
  - `new` creates new objects in the given class
- We will learn (much) more about objects later

CMSC 131 Spring 2008  
Jan Plane (adapted from Bonnie Dorr)

25

## Debugging Java Programs

- Types of errors
  - "Compile time": caught by Eclipse / Java compiler
    - *Syntax errors*
      - disobeys the rules of the language; violates language's grammar
    - *Type errors*: misuse of variables
  - "Run time": appear during program execution
    - Semantic errors
      - obeys the rules of the language but does not express them meaning you intended;
    - division by 0
    - crash or hang or wrong outputs (because of mistakes in programming)
- Eclipse helps catch compile time errors
  - Red: error
  - Yellow: warning
- Debugging
  - process of finding and fixing problems
  - to minimize debugging frustration – use "unit" testing
    - write a small part, thoroughly test it, cycle back

CMSC 131 Spring 2008  
Jan Plane (adapted from Bonnie Dorr)

26

## Example3.java – find the errors

```
public class Example3 {
 public static void main(String[] args) {
 int x = 7;
 int y = 12;
 double d = 72.33;
 boolean b = true;
 char c;
 String s;

 x = y + 24;
 y = 17.3;
 d = x;
 b = 17;
 c = "cow";
 s = "Here is something weird " + x + y;
 }
}
```

CMSC 131 Spring 2008  
Jan Piatek (adapted from Bonnie Dorr)
