

ANNOUNCEMENTS

❖ None

USABILITY: FRAMES

- ❖ **Frame**
 - ❖ Allows us to view several HTML documents in the same window.
 - ❖ A page can be loaded in a frame while other stay constant.
 - ❖ **Example:**
<http://java.sun.com/j2se/1.5.0/docs/api/index.html>
- ❖ **Causes big problems from a usability point of view**
 - ❖ Bookmarking will not work as expected.
 - ❖ Search engines have difficulties with frames.
 - ❖ Printing can be problematic.
- ❖ Effects associated with frames can be achieved via CSS positioning and **<div>** tag.

GUIDELINES FOR AN USABLE WEB SITE

- ❖ **Visual Consistency** - When a new page is selected in a site it should be easy to identify it belongs to the same site.
 - ❖ You can achieve consistency by
 - ❖ Using logos or banners.
 - ❖ Keeping a consistent layout and configuration of elements. For example:
 - ❖ Navigation bar is consistent in its placement and appearance.
 - ❖ Consistent coloring.
 - ❖ If the layout is not consistent you can use identical colors and shape elements to make pages appear consistent.
- ❖ **Navigation** – For an easily navigable site users should be clear about:
 - ❖ Where they will go when selecting a link.
 - ❖ Where they are in the site.
 - ❖ How to get back to a recognizable starting place.

GUIDELINES FOR AN USABLE WEB SITE

- ❖ **Navigation: Approaches to organize a site**
 - ❖ **Sequential Organization** – Pages follow a certain order and are linked to one another in order. Appropriate for scenarios were:
 - ❖ Sequence of steps needed to complete a task are described.
 - ❖ A story is told.
 - ❖ Chronological information is presented.
 - ❖ **Hierarchical Organization** – Appropriate for sites with a very large number of pages. A main page has categories with subcategories, etc. Users should know their position in the structure.
 - ❖ **Web-based Organization** – Most common organizational structure.
 - ❖ Web-like structure (should not force one of the organizations previously discussed).
 - ❖ Pages link to one another based on content
 - ❖ A page could be accessible only from one particular page.
 - ❖ A page can connect many pages.
 - ❖ Etc.

GUIDELINES FOR AN USABLE **WEB SITE**

❖ **Links**

- ❖ Links names should be descriptive and indicate where the links go.
- ❖ Rather than next, prev, up, down add a description of the nature of the page that will be reached.

“next: Weather in the USA”

“up: Courses at UMCP”

❖ **Search**

- ❖ Search tools for an entire web site can help users find what they need.
- ❖ The search should search the web site by default.

SECURITY (EMAIL)

- ❖ Least secure of internet protocols.
- ❖ Avoid sending sensitive information (e.g., passwords) over e-mail.
- ❖ Provide e-mail addresses in web sites in a way is not easily recognized by spam programs.
 - ❖ Use at rather than @.
 - ❖ Put an image with the e-mail.
 - ❖ Avoid mailto.
- ❖ Encrypt the message using PGP (Pretty Good Privacy) or GPG (GNU Privacy Guard).

SECURITY (PASSWORD-PROTECTED SITES)

❖ **Approach not recommended**

- ❖ Store encrypted password.
- ❖ Decrypt password and compare against user provided password.

❖ **Better approach**

- ❖ Store encrypted password.
- ❖ Encrypt provided password and compare against stored password.

SECURITY (ENCRYPTION)

- ❖ **Encryption** – process of converting plaintext into ciphertext.
- ❖ **Decryption** – process of converting ciphertext into plaintext.
- ❖ **Symmetric cryptography** – sender and receiver share the same key.
- ❖ **Asymmetric (Public Key) cryptography** – sender and receiver have different, complementary keys.
- ❖ **Symmetric cryptography**
 - ❖ Example algorithms: DES, Triple-Des, RC4.
 - ❖ Relatively fast compared to Asymmetric.
 - ❖ Drawbacks
 - ❖ Keys must be change frequently.
 - ❖ How to distribute the key safely.

SECURITY (ENCRYPTION)

- ❖ **Branches of public key cryptography**
 - ❖ Public key encryption
 - ❖ Digital signatures
- ❖ **Public key Encryption**
 - ❖ Example algorithm: RSA
 - ❖ Relatively slowed compared to Asymmetric.
 - ❖ How it works?
 - ❖ Each user has a public/private key pair.
 - ❖ Public key is widely known.
 - ❖ Private key only known by user that generated it.
 - ❖ If user A wants to send user B a message, user A encrypts message with B's public key. B will decrypt the message with B's private key. The only way to decrypt the message is by using B's private key.
- ❖ **Digital signature**
 - ❖ Message signed with sender's private key can be verified by anyone with sender's public key thereby proving message authenticity.

DIGITAL CERTIFICATES (CERTIFICATES)

- ❖ **Digital Certificates** – electronic documents that contain information about a public key and the owner (name, address, etc.).
- ❖ Employed to verify a public key corresponds to a particular organization.
- ❖ Certificates must be issued by a trusted third party known as certificate authority (CA) which guarantees the information is correct.
- ❖ **About certificates**
 - ❖ Have a validity period and can expire.
 - ❖ They can be revoked.
 - ❖ Browsers have a collection of root certificates.
 - ❖ Main standard X.509.

MESSAGE DIGESTS

- ❖ Message digest – fixed-length representation of a message.
- ❖ Expected properties for message digest (“Hashing”) algorithm
 - ❖ Original message cannot be obtained from the digest.
 - ❖ Two different messages should have different digests.
- ❖ Example algorithms: MD5 and SHA

NEED FOR SECURITY

- ❖ **SSL (Secure Sockets Layer) Protocol** – Protocol that enable us to satisfy the need for security in client-web server transactions.
- ❖ The algorithm provides support for confidentiality, integrity and authentication.
- ❖ **SSL connection is established as follows:**
 - ❖ User connects to web server through the browser.
 - ❖ Browser and server exchange public keys and certificate information.
 - ❖ Browser checks server certificate validity (certificate not expired, issued by CA, etc.).
 - ❖ Optional: server can request a valid certificate from the client.
 - ❖ Using public keys server and client determine a symmetric key to use.
 - ❖ Communication from this point on is through symmetric cryptography.

HTTPS

- ❖ **https** – http where
 - ❖ A different default port (443) is used.
 - ❖ An extra layer of encryption/authentication exists between HTTP and TCP.
- ❖ **https** – is not a separate protocol but a combination of HTTP over encrypted SSL or TLS transport mechanism.
- ❖ **TLS** – Transport Layer Security
 - ❖ IETF standard designed to standardize SSL as an Internet protocol.
 - ❖ Slight differences between SSL 3.0 and TLS 1.0.
