

Announcements

- ❖ Check class announcements daily
- ❖ You must implement programming projects by yourself

Project #5

- ❖ Let's talk about project #5

Usability: Frames

- ❖ **Frame**
 - ❖ Allows us to view several HTML documents in the same window
 - ❖ A page can be loaded in a frame while other stay constant
 - ❖ **Example:**
<http://java.sun.com/j2se/1.5.0/docs/api/index.html>
- ❖ **Causes big problems from a usability point of view**
 - ❖ Bookmarking will not work as expected
 - ❖ Search engines have difficulties with frames
 - ❖ Printing can be problematic
- ❖ Effects associated with frames can be achieved via CSS positioning and **<div>** tag.

Guidelines for an Usable Web Site

- ❖ **Visual Consistency** → When a new page is selected in a site it should be easy to identify it belongs to the same site
 - ❖ You can achieve consistency by
 - ❖ Using logos or banners
 - ❖ Keeping a consistent layout and configuration of elements. For example:
 - ❖ Navigation bar is consistent in its placement and appearance
 - ❖ Consistent coloring
 - ❖ If the layout is not consistent you can use identical colors and shape elements to make pages appear consistent
- ❖ **Navigation** → For an easily navigable site users should be clear about:
 - ❖ Where they will go when selecting a link
 - ❖ Where they are in the site
 - ❖ How to get back to a recognizable starting place

Guidelines for an Usable Web Site

- ❖ **Navigation: Approaches to organize a site**
 - ❖ **Sequential Organization** → Pages follow a certain order and are linked to one another in order. Appropriate for scenarios were:
 - ❖ Sequence of steps needed to complete a task are described
 - ❖ A story is told
 - ❖ Chronological information is presented
 - ❖ **Hierarchical Organization** → Appropriate for sites with a very large number of pages. A main page has categories with subcategories, etc. Users should know their position in the structure
 - ❖ **Web-based Organization** → Most common organizational structure
 - ❖ Web-like structure (should not force one of the organizations previously discussed)
 - ❖ Pages link to one another based on content
 - ❖ A page could be accessible only from one particular page
 - ❖ A page can connect many pages
 - ❖ Etc.

Guidelines for an Usable Web Site

❖ **Links**

- ❖ Links names should be descriptive and indicate where the links go
- ❖ Rather than next, prev, up, down add a description of the nature of the page that will be reached.

“next: Weather in the USA”

“up: Courses at UMCP”

❖ **Search**

- ❖ Search tools for an entire web site can help users find what they need
- ❖ The search should search the web site by default

Security (Email)

- ❖ Least secure of internet protocols
- ❖ Avoid sending sensitive information (e.g., passwords) over e-mail
- ❖ Provide e-mail addresses in web sites in a way is not easily recognized by spam programs
 - ❖ Use at rather than @
 - ❖ Put an image with the e-mail
 - ❖ Avoid mailto
- ❖ Encrypt the message using PGP (Pretty Good Privacy) or GPG (GNU Privacy Guard)
- ❖ <http://www.wbwip.com/wbw/emailencoder.html>

Security (Password-Protected Sites)

❖ **Approach not recommended**

- ❖ Store encrypted password
- ❖ Decrypt password and compare against user provided password

❖ **Better approach**

- ❖ Store encrypted password
- ❖ Encrypt provided password and compare against stored password

Security (Encryption)

- ❖ **Encryption** → process of converting plaintext into ciphertext
- ❖ **Decryption** → process of converting ciphertext into plaintext
- ❖ **Symmetric cryptography** → sender and receiver share the same key
- ❖ **Asymmetric (Public Key) cryptography** → sender and receiver have different, complementary keys
- ❖ **Symmetric cryptography**
 - ❖ Example algorithms: DES, Triple-Des, RC4.
 - ❖ Relatively fast compared to asymmetric
 - ❖ Drawbacks
 - ❖ Keys must be change frequently
 - ❖ How to distribute the key safely

Security (Encryption)

- ❖ **Branches of public key cryptography**
 - ❖ **Public key encryption**
 - ❖ **Digital signatures**
- ❖ **Public key Encryption**
 - ❖ Example algorithm: RSA
 - ❖ Relatively slowed compared to symmetric
 - ❖ How it works?
 - ❖ Each user has a public/private key pair.
 - ❖ Public key is widely known
 - ❖ Private key only known by user that generated it
 - ❖ If user A wants to send user B a message, user A encrypts message with B's public key. B will decrypt the message with B's private key. The only way to decrypt the message is by using B's private key
- ❖ **Digital signature**
 - ❖ Message signed with sender's private key can be verified by anyone with sender's public key thereby proving message authenticity

Digital Certificates (Certificates)

- ❖ **Digital Certificates** → electronic documents that contain information about a public key and the owner (name, address, etc.)
- ❖ Employed to verify a public key corresponds to a particular organization
- ❖ Certificates must be issued by a trusted third party known as certificate authority (CA) which guarantees the information is correct
- ❖ **About certificates**
 - ❖ Have a validity period and can expire
 - ❖ They can be revoked
 - ❖ Browsers have a collection of root certificates
 - ❖ In Firefox – Tools → Options → Advanced → View Certificates
 - ❖ Main standard X.509

Message Digests

- ❖ Message digest → fixed-length representation of a message
- ❖ Expected properties for message digest (“Hashing”) algorithm
 - ❖ Original message cannot be obtained from the digest
 - ❖ Two different messages should have different digests
- ❖ Example algorithms: MD5 and SHA

Need For Security

- ❖ **SSL (Secure Sockets Layer) Protocol** → Protocol that enable us to satisfy the need for security in client-web server transactions
- ❖ The algorithm provides support for confidentiality, integrity and authentication
- ❖ **SSL connection is established as follows:**
 - ❖ User connects to web server through the browser
 - ❖ Browser and server exchange public keys and certificate information
 - ❖ Browser checks server certificate validity (certificate not expired, issued by CA, etc.)
 - ❖ Optional: server can request a valid certificate from the client
 - ❖ Using public keys server and client determine a symmetric key to use
 - ❖ Communication from this point on is through symmetric cryptography

https

- ❖ **https** → http where
 - ❖ A different default port (443) is used
 - ❖ An extra layer of encryption/authentication exists between HTTP and TCP
- ❖ **https** → is not a separate protocol but a combination of HTTP over encrypted SSL or TLS transport mechanism
- ❖ **TLS** → Transport Layer Security
 - ❖ IETF standard designed to standardize SSL as an Internet protocol
 - ❖ Slight differences between SSL 3.0 and TLS 1.0
