CMSC 330: Organization of Programming Languages

Strings, Slices, Vectors, HashMaps in Rust

String Representation

- Rust's String is a 3-tuple
 - A pointer to a byte array (interpreted as UTF-8)
 - A (current) length
 - A (maximum) capacity

Always: length ≤ capacity

s1

name	value		index	value
ptr		-	0	h
len	5		1	e
capacity	5		2	1
ointed-to data is			3	1
			4	O

String pointed-to data is dropped when the owner is

String Representation

- Rust's String is a 3-tuple
 - A pointer to a byte array (interpreted as UTF-8)
 - A (current) length
 - A (maximum) capacity
 - Always: length ≤ capacity

```
let mut s = String::new();
println!("{}", s.capacity());
for _ in 0..5 {
   s.push_str("hello");
   println!("{},{}",
       s.len(),s.capacity());
}
```

Code Prints

```
0
5,5
10,10
15,20
20,20
25,40
```

Slices: Motivation

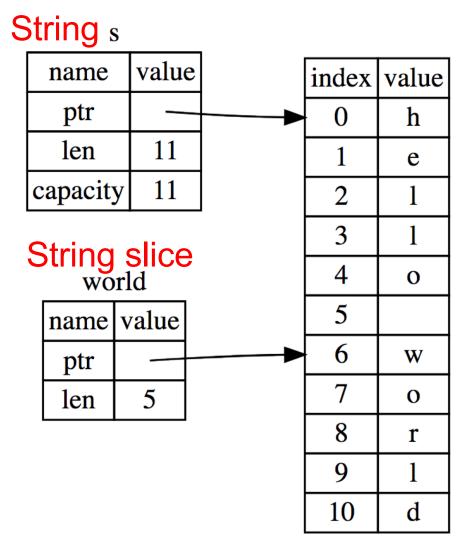

Suppose we want the first word of a string.
 Here's how we might do it in OCaml

```
let first_word s =
  try
  let i = String.index s ' ' in
  String.sub s 0 i
  with Not_found -> s
```

- String.sub allocates new memory and copies the sub-string's contents
 - This is a waste (especially with a large string) if both
 and its substring are to be treated as immutable

Slice: Shared Data, Separate Metadata

- What we want is to have both strings share the same underlying data
- Happily, Rust's containers permit a way to present a slice of an object's contents

String Slices in Rust

- If s is a String, then &s [range] is a string slice, where range can be as follows.
 - -i...j is the range from i to j, inclusive
 - i.. is the range from i to the current length
 - . . j is the range from 0 to j
 - is the range from 0 to the current length
- &str is the type of a String slice

String Slice Example

Here's first_word in Rust, using slices:

```
fn first_word(s: &String) -> &str {
  let bytes = s.as_bytes();
  for (i, &item) in
        bytes.iter().enumerate() {
    if item == b' ' {
        return &s[0..i];
    }
  }
  &s[..]
}
```

Using String Slices

- A &str slice borrows from the original string
 - Just like an immutable String reference
 - This prevents dangling pointers

```
let mut s = String::from("hello world");
let word = first_word(&s); //borrow
s.clear(); // Error! Can't take mut ref
```

String literals are slices

```
let s:&str = "hello world";
```

- Should use slices where possible
 - E.g., fn first_word(s:&str) -> &str
 - Can convert **String** s to a slice via **&s[..]**. Oftentimes, this coercion is done automatically (due to **Deref** trait)

Strings Miscellany

- push_str(&mut self, string: &str)
 - string argument is a slice, so doesn't take ownership, while self is a mutable reference, implying it is the only such reference
- Iteration over chars, bytes, etc. Code

```
let s = String::from("hello");
for (i,c) in s.char_indices() {
  println!("{},{}",i,c);
}
```

See also split_at_whitespace

Prints

```
0,h
1,e
2,l
3,l
4,o
```

Vectors: Basics

Vec<T> in Rust is Arraylist<T> in Java

```
{ let mut v:Vec<i32> = Vec::new();
  v.push(1); // adds 1 to v
  v.push("hi"); //error - v contains i32s
  let w = vec![1, 2, 3];
} // v,w and their elements dropped
```

Indexing can fail (panic) or return an Option

```
let v = vec![1, 2, 3, 4, 5];
let third:&i32 = &v[2]; //panics if OOB
let third:Option<&i32> = v.get(2); //None if OOB
```

Aside: Options

- Option<T> is an enumerated type, like an OCaml variant
 - Some (v) and None are possible values

```
let v = vec![1, 2, 3, 4, 5];
let third:Option<&i32> = v.get(2);
let z =
  match third {
    Some(i) => Some(i+1), //matches here
    None => None
};
```

- We'll see more about enumerated types later
 - For now, follow your nose

Vectors: Updates and Iteration

```
let mut a = vec![10, 20, 30, 40, 50];
{ let p = &mut a[1]; //mutable borrow
  *p = 2; //updates a[1]
}//ownership restored
println!("vector contains {:?}",&a);
```

- If we remove the { } block around the def of p,
 above, then the code fails
 - Not allowed to print via a while mutable borrow p is out
- Iterator variable can be mutable or immutable:

```
let v = vec![100, 32, 57];
for i in &v { println!("{}", i); }
for i in &mut v { *i += 50; }
```

Vector and Strings

• Like Strings, vectors can have slices

```
let a = vec![10, 20, 30, 40, 50];
let b = &a[1..3]; //[20,30]
let c = &b[1]; //30
println!("{}",c); //prints 30
```

Strings implemented internally as a Vec<u8>

HashMaps

 HashMap<K,V> has the expected methods (roughly – see manual for gory details)
