CMSC 330: Organization of Programming Languages

OCaml Data Types

OCaml Data

- So far, we've seen the following kinds of data
  - Basic types (int, float, char, string)
  - Lists
    - One kind of data structure
    - A list is either [ ] or h::t, deconstructed with pattern matching
  - Tuples and Records
    - Let you collect data together in fixed-size pieces
  - Functions

- How can we build other data structures?
  - Building everything from lists and tuples is awkward

User Defined Types

type can be used to create new names for types

- Like typedef in C – a name might be more useful for communicating intent than just the type structure

Example

```
# type mylist = int*(int list);;
type mylist = int * int list
# let empty:mylist = (0,[]);;
val empty : mylist = (0, [])
# let add x ((n,xs):mylist) mylist = (n+1,x::xs);;
val add : int -> mylist -> mylist = <fun>
# let length ((n,_):mylist) = n;;
val length : mylist -> int = <fun>
# let x = add 1 (add 2 empty);;
val x : mylist = (2, [1; 2])
```

Annotation required to tell type inference you want mylist, not int*int list

3

(User-Defined) Variants

```
type coin = Heads | Tails

let flip x =
  match x with
    Heads -> Tails
  | Tails -> Heads

let rec count_heads x =
  match x with
    [] -> 0
  | (Heads::x') -> 1 + count_heads x'
  | (_::x') -> count_heads x'
```

In simplest form: Like a C `enum`

Basic pattern matching resembles C `switch`

Combined list and variant patterns possible

4

Constructing and Destructing Variants

- Syntax
  - `type t = C1 | … | Cn`
  - the `Ci` are called constructors
    - ➢ Must begin with a capital letter
- Evaluation
  - A constructor `Ci` is already a value
  - Destructing a value `v` of type `t` is done by pattern matching on `v` ; the patterns are the constructors `Ci`
- Type Checking
  - `Ci` : `t` (for each `Ci` in `t`'s definition)

Data Types: Variants with Data

- We can define variants that "carry data" too
  - Not just a constructor, but a constructor *plus values*

```
type shape =
    Rect of float * float (* width*length *)
  | Circle of float       (* radius *)
```

- **Rect** and **Circle** are constructors
  - where a **shape** is either a **Rect(w,l)**
    - for any floats **w** and **l**
  - or a **Circle r**
    - for any float **r**

Data Types (cont.)

```
let area s =
  match s with
      Rect (w, l) -> w *. l
    | Circle r -> r  *. r *. 3.14
;;
area (Rect (3.0, 4.0));; (* 12.0  *)
area (Circle 3.0);;      (* 28.26 *)
```

- Use pattern matching to deconstruct values

  - Can bind pattern values to data parts

- Data types are *aka* algebraic data types and tagged unions

Data Types (cont.)

```
type shape =
    Rect of float * float (* width*length *)
  | Circle of float       (* radius *)

let lst = [Rect (3.0, 4.0) ; Circle 3.0]
```

- What's the type of `lst`?
  - **shape list**
- What's the type of `lst`'s first element?
  - **shape**

Variation: Shapes in Java Compare this to OCaml

```java
public interface Shape {
    public double area();
}
```

```java
class Rect implements Shape {
  private double width, length;

  Rect (double w, double l) {
    this.width = w;
    this.length = l;
  }

  double area() {
    return width * length;
  }
}
```

```java
class Circle implements Shape {
  private double rad;

  Circle (double r) {
    this.rad = r;
  }

  double area() {
    return rad * rad * 3.14159;
  }
}
```

Option Type

```
type optional_int =
    None
  | Some of int

let divide x y =
  if y != 0 then Some (x/y)
  else None

let string_of_opt o =
  match o with
    Some i -> string_of_int i
  | None -> "nothing"
```

```
let p = divide 1 0;;
print_string
   (string_of_opt p);;
(* prints "nothing" *)

let q = divide 1 1;;
print_string
   (string_of_opt q);;
(* prints "1" *)
```

- Comparing to Java: **None** is like **null**, while **Some** *i* is like an **Integer(*i*)** object

Polymorphic Option Type

- A Polymorphic version of **option** type can work with *any kind of data*

  - As int option, char option, etc...

*Polymorphic parameter: like **Option<T>** in Java*

```
type 'a option =
   Some of 'a
| None
```

In fact, this option type is built into OCaml

```
let opthd l =
   match l with
      [] -> None
   | x::_ -> Some x
```

```
let p = opthd [];;      (* p = None *)
let q = opthd [1;2];;    (* q = Some 1 *)
let r = opthd ["a"];;    (* r = Some "a" *)
```

Quiz 1

```
type foo = (int * (string list)) list
```

Which one of the following could match foo?

A. `[(3, "foo", "bar")]`
B. `[(7, ["foo"; "bar"])]`
C. `[(5, ["foo", "bar"])]`
D. `[(9, [("foo", "bar")])]`

Quiz 1

```
type foo = (int * (string list)) list
```

Which one of the following could match foo?

A. `[(3, "foo", "bar")]`
B. `[(7, ["foo"; "bar"])]`
C. `[(5, ["foo", "bar"])]`
D. `[(9, [("foo", "bar")])]`

Quiz 2: What does this evaluate to?

```
type num = Int of int | Float of float;;
let plus a b =
  match a, b with
  | Int i, Int j -> Int (i+j)
  | Float i, Float j -> Float (i +. j)
  | Float i, Int j -> Float (i +. float_of_int  j)
;;
plus (Float 3.0) (Int 2);;
```

A. **Float 5.0**

B. **5.0**

C. **Int 5**

D. Type Error

Quiz 2: What does this evaluate to?

```
type num = Int of int | Float of float;;
let plus a b =
  match a, b with
  | Int i, Int j -> Int (i+j)
  | Float i, Float j -> Float (i +. j)
  | Float i, Int j -> Float (i +. float_of_int  j)
;;
plus (Float 3.0) (Int 2);;
```

A. **Float 5.0**

B. 5.0

C. Int 5

D. Type Error

Quiz 3: What does this evaluate to?

```
let foo f = match f with
    None -> 42.0
  | Some n -> n +. 42.0
;;
foo 3.3;;
```

A. **45.3**

B. **42.0**

C. **Some 45.3**

D. Error

Quiz 3: What does this evaluate to?

```
let foo f = match f with
    None -> 42.0
  | Some n -> n +. 42.0
;;
foo 3.3;;   foo (Some 3.3)
```

A. **45.3**

B. **42.0**

C. **Some 45.3**

D. **Error**

Recursive Data Types

- We can build up lists with recursive variant types

```
type 'a mylist =
    Nil
  | Cons of 'a * 'a mylist

let rec len = function
    Nil -> 0
  | Cons (_, t) -> 1 + (len t)

len (Cons (10, Cons (20, Cons (30, Nil))))
(* evaluates to 3 *)
```

- Won't have nice [1; 2; 3] syntax for this kind of list

Variants (full definition)

- **Syntax**
  - `type t = C1 [of t1] | ... | Cn [of tn]`
  - the `Ci` are called constructors
    - ➤ Must begin with a capital letter; may include associated data notated with brackets [] to indicate it's optional

- **Evaluation**
  - A constructor `Ci` is a value if it has no assoc. data
    - ➤ `Ci vi` is a value if it does
  - Destructing a value of type `t` is by pattern matching
    - ➤ patterns are constructors `Ci` with data components, if any

- **Type Checking**
  - `Ci [vi] : t` [if `vi` has type `ti`]

OCaml Exceptions

```ocaml
exception My_exception of int
let f n =
  if n > 0 then
    raise (My_exception n)
  else
    raise (Failure "foo")
let bar n =
  try
    f n
  with My_exception n ->
      Printf.printf "Caught %d\n" n
    | Failure s ->
      Printf.printf "Caught %s\n" s
```

Exceptions (cont.)

- Exceptions are declared with exception

    - They may appear in the signature as well

- Exceptions may take arguments

    - Just like type constructors

    - May also have no arguments

- Catch exceptions with try...with...

    - Pattern-matching can be used in with

    - If an exception is uncaught

        - Current function exits immediately

        - Control transfers up the call chain

        - Until the exception is caught, or until it reaches the top level

OCaml Exceptions (cont.)

- **`failwith`**: Raise exception Failure with the given string.
- **`invalid_arg`**: Raise exception Invalid_argument with the given string
- **`Not_found`**: Raised if the object does not exist

```
let div x y =
 if y = 0 failwith "divide by zero" else x/y;;
let lst =[(1,"alice");(2,"bob");(3,"cat")];;
let lookup key lst =
   try
      List.assoc key lst
    with
      Not_found -> "key does not exist"
```
