

CMSC 132: OBJECT-ORIENTED PROGRAMMING II

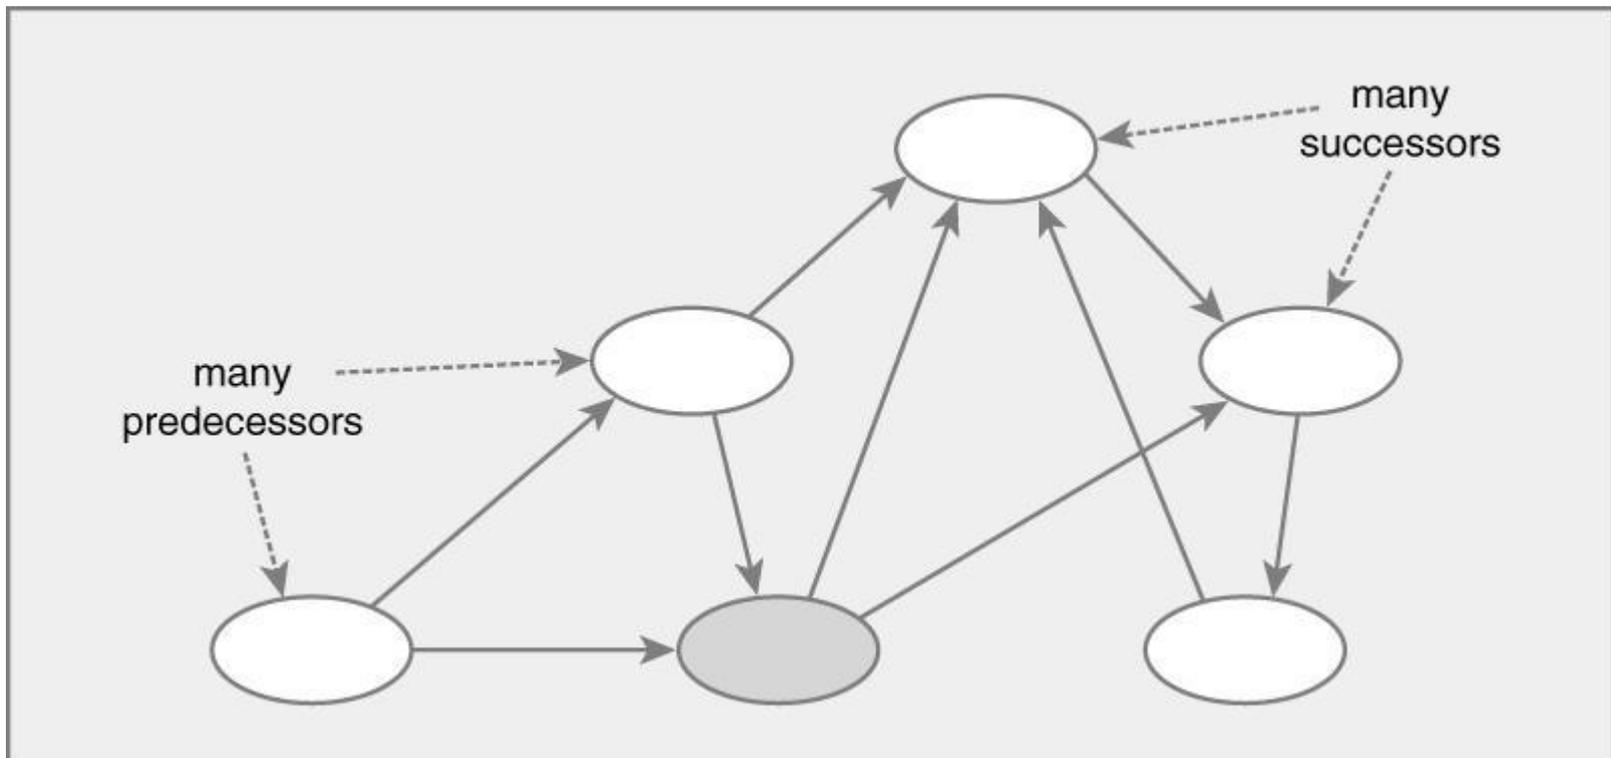

Graphs & Graph Traversal

Department of Computer Science
University of Maryland, College Park

Graph Data Structures

- Many-to-many relationship between elements
 - Each element has **multiple** predecessors
 - Each element has **multiple** successors

Graph Definitions

- Node

- Element of graph
- State
 - List of **adjacent/neighbor/successor** nodes

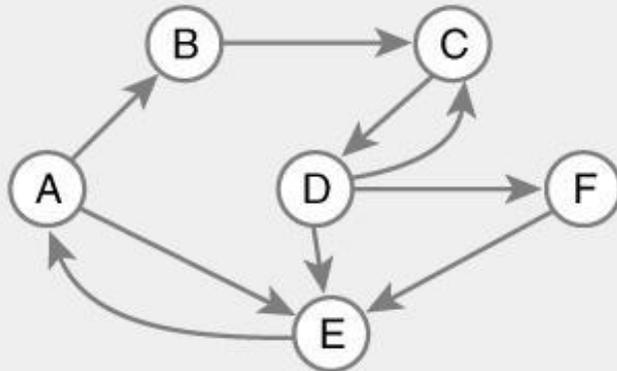

- Edge

- Connection between two nodes
- State
 - Endpoints of edge

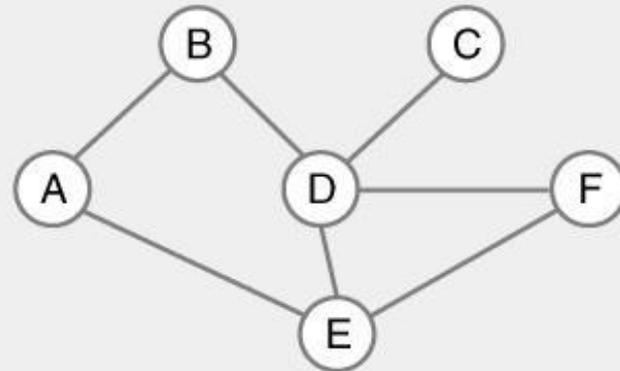

Graph Definitions

- Directed graph
 - Directed edges
- Undirected graph
 - Undirected edges

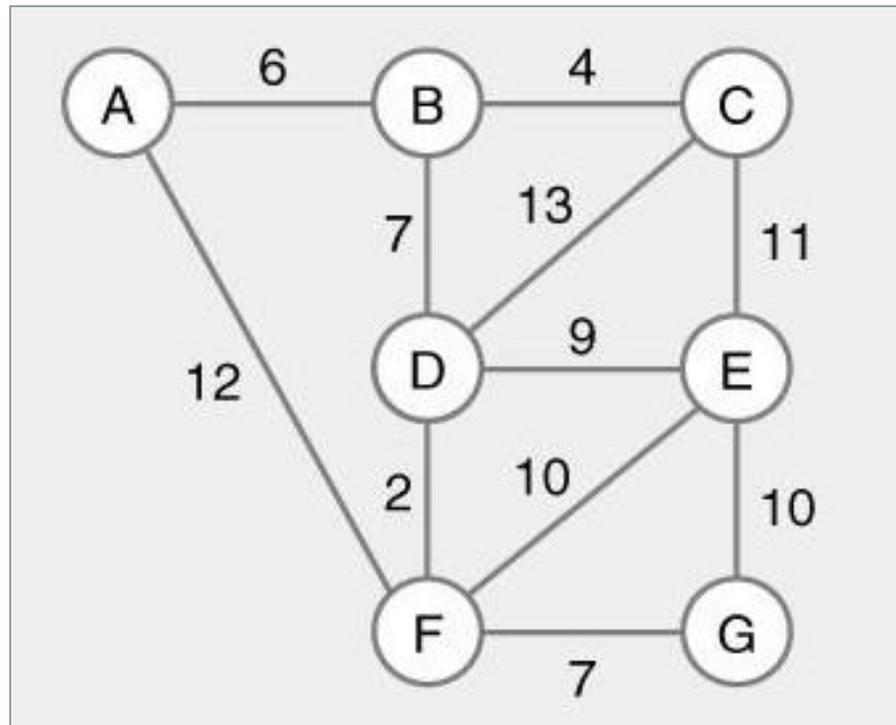

(a) Directed graph

(b) Undirected graph

Graph Definitions

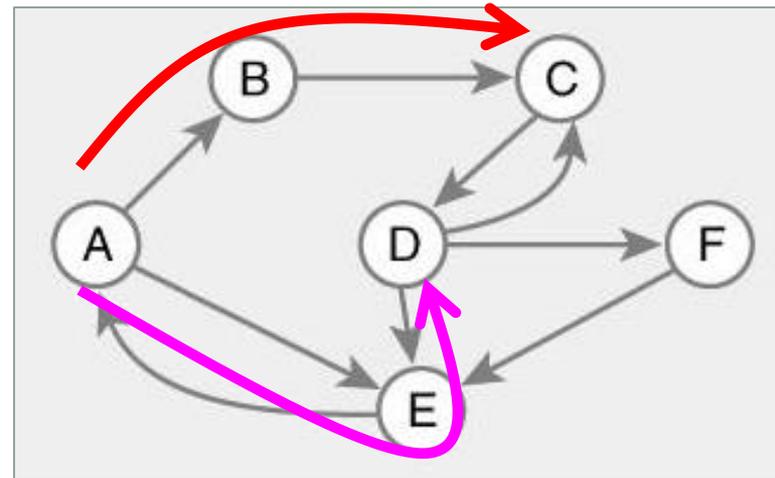

- Weighted graph
 - Weight (cost) associated with each edge

Graph Definitions

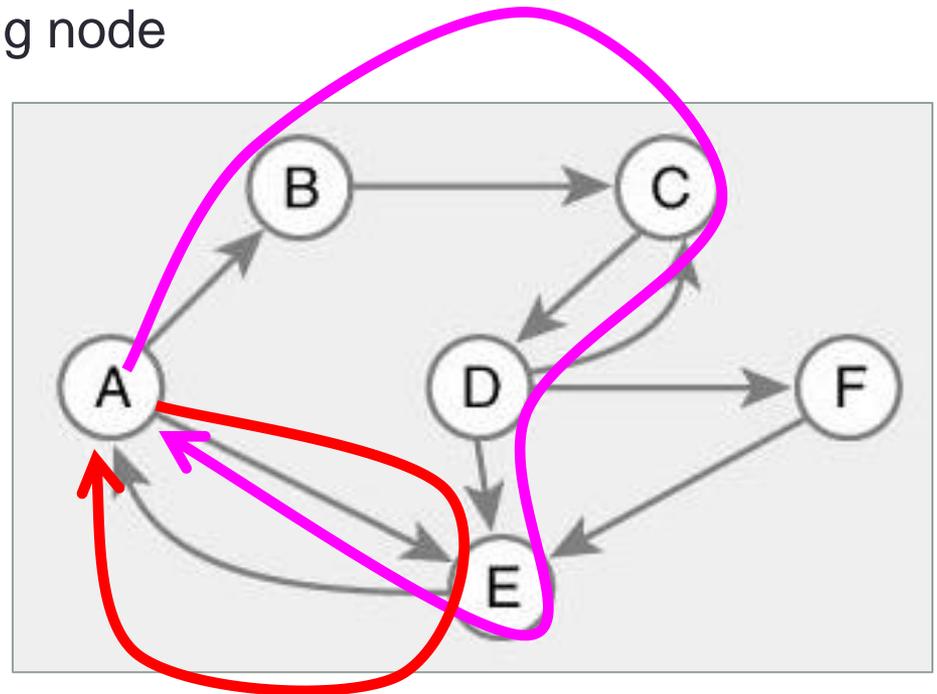

- Path

- Sequence of nodes n_1, n_2, \dots, n_k
- Edge exists between each pair of nodes n_i, n_{i+1}
- Example
 - A, B, C is a path
 - A, E, D is not a path

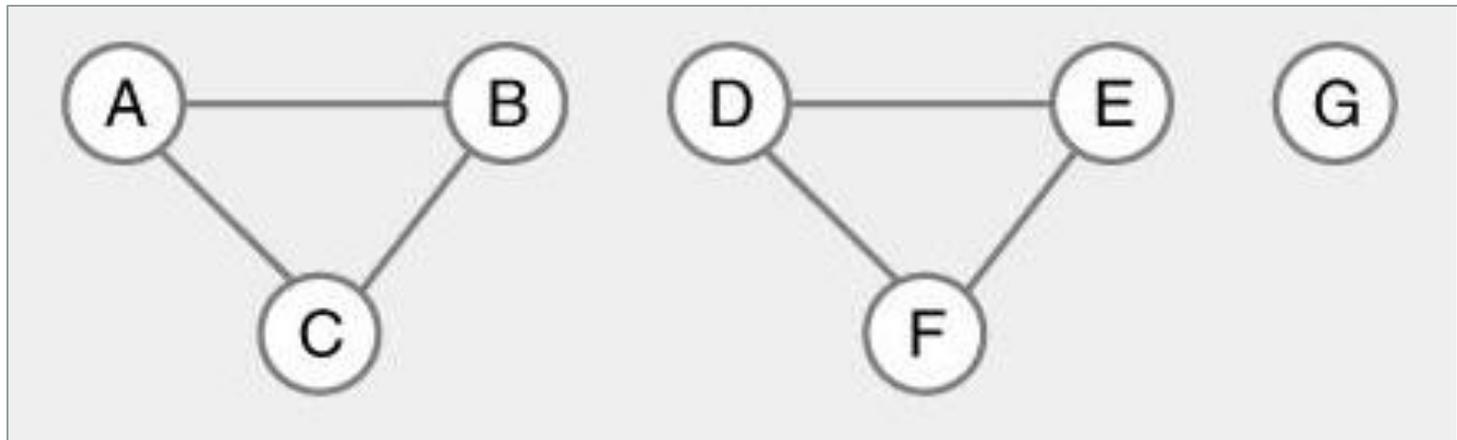

Graph Definitions

- Cycle
 - Path that ends back at starting node
 - Example
 - A, E, A
 - A, B, C, D, E, A
- Simple path
 - No cycles in path
- Acyclic graph
 - No cycles in graph
 - What is an example?

Graph Definitions

- Connected Graph
 - Every node in the graph is reachable from every other node in the graph
- Unconnected graph
 - Graph that has several disjoint components

Unconnected graph

Graph Operations

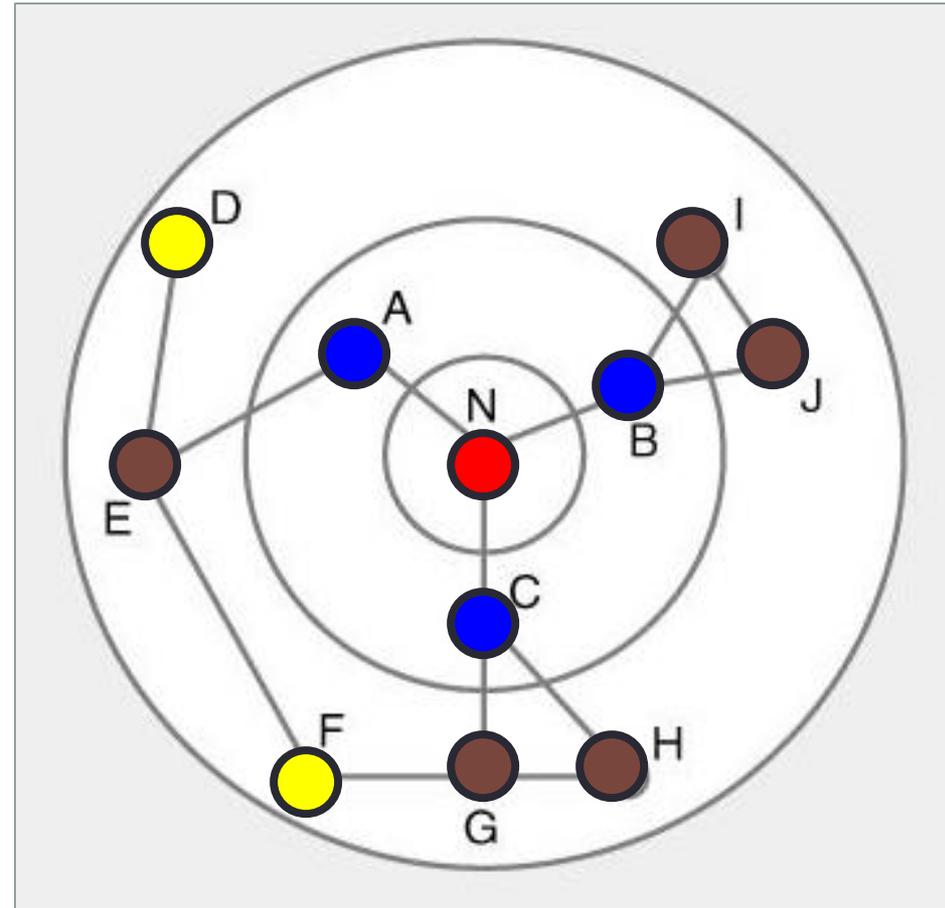

- Traversal (search)
 - Visit each node in graph exactly once
 - Usually perform computation at each node
 - Two approaches
 - Breadth first search (BFS)
 - Depth first search (DFS)

Traversals Orders

- Order of successors
 - For tree
 - Can order children nodes from left to right
 - For graph
 - Left to right doesn't make much sense
 - Each node just has a set of successors and predecessors; there is no order among edges
- For breadth first search
 - Visit all nodes at distance k from starting point
 - Before visiting any nodes at (minimum) distance $k+1$ from starting point

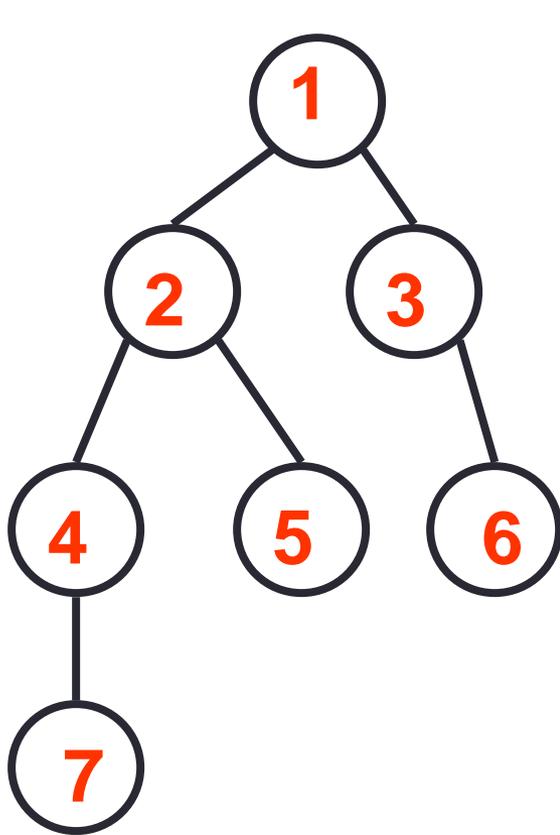

Breadth-first Search (BFS)

- Approach
 - Visit all neighbors of node first
 - View as series of expanding circles
 - Keep list of nodes to visit in queue
- Example traversal
 1. n
 2. a, c, b
 3. e, g, h, i, j
 4. d, f

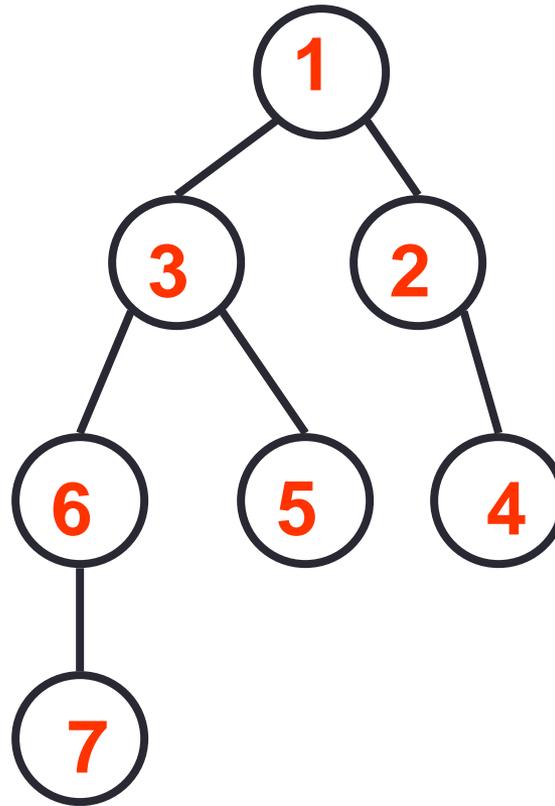

Breadth-first Tree Traversal

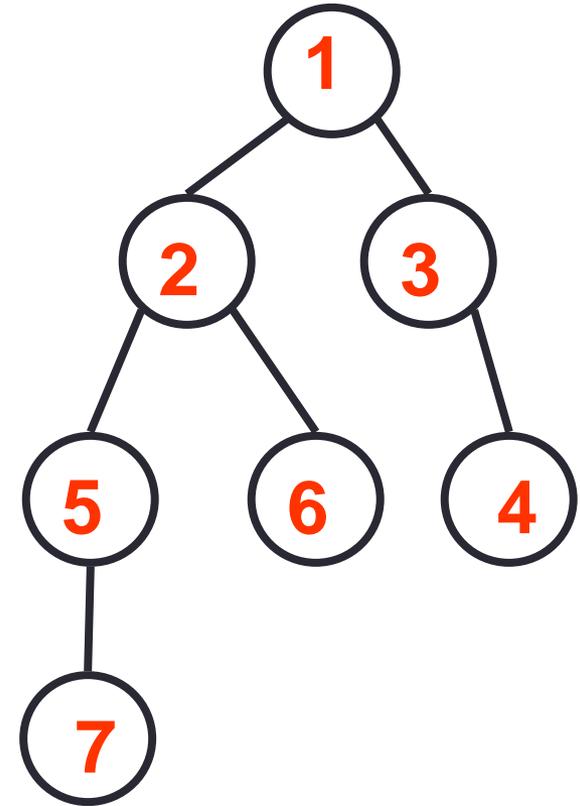

- Example traversals starting from 1

Left to right

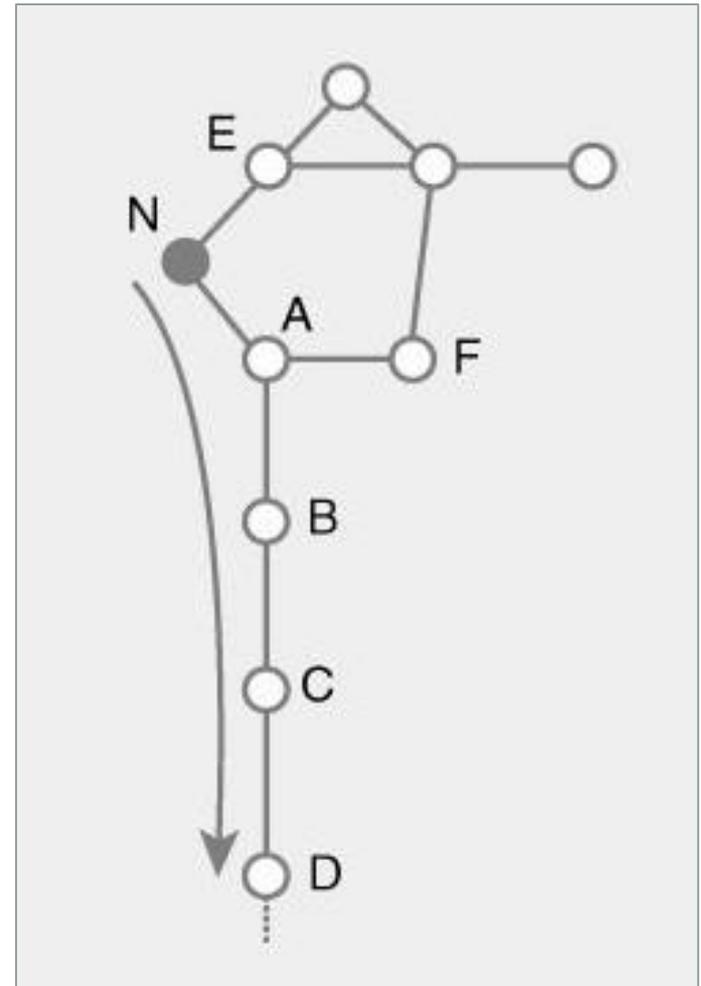

Right to left

Random

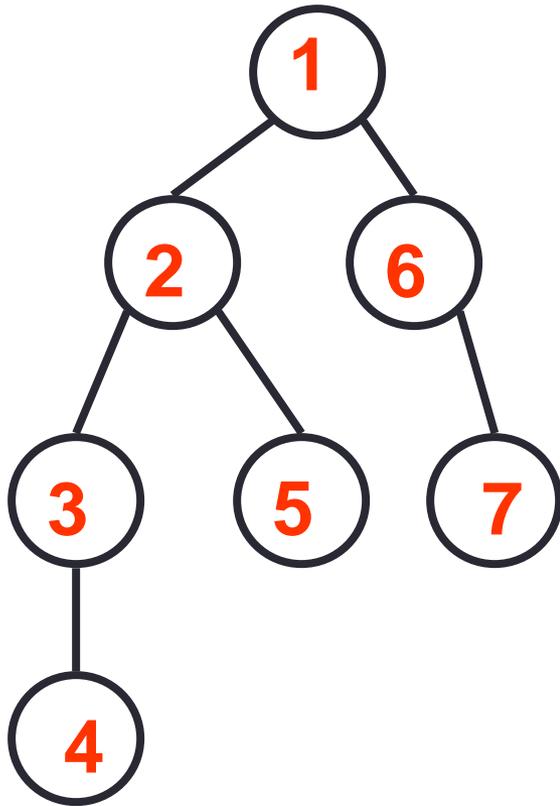

Depth-first Search (DFS)

- Approach
 - Visit all nodes on path first
 - **Backtrack** when path ends
 - Keep list of nodes to visit in a stack
- Similar to process in maze without exit
- Example traversal
 1. N
 2. A
 3. B, C, D, ...
 4. F...

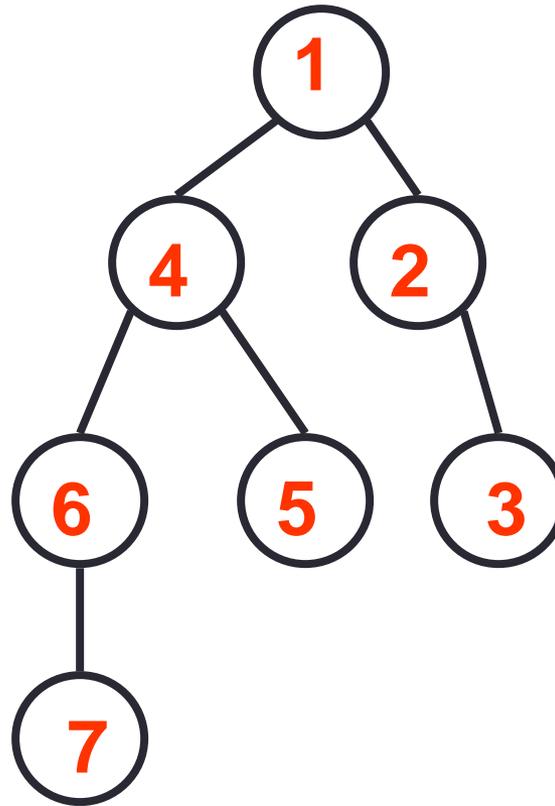

Depth-first Tree Traversal

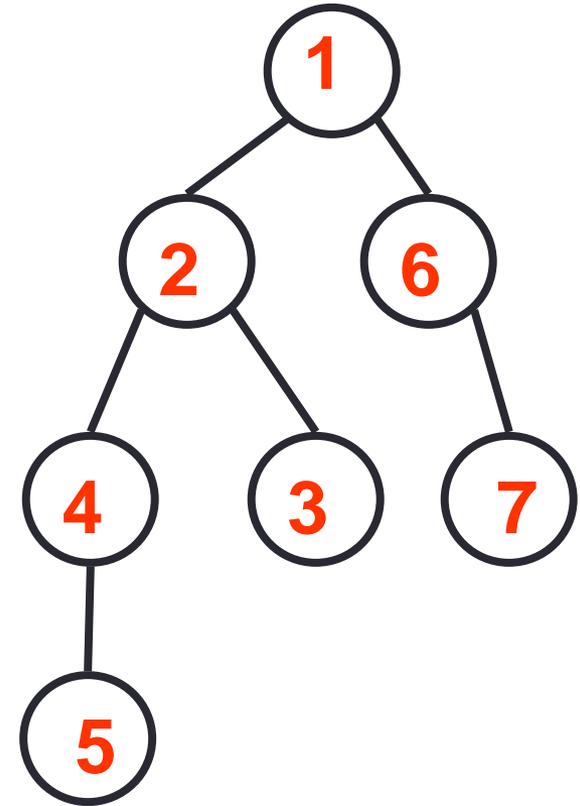

- Example traversals from 1 (preorder)

Left to right

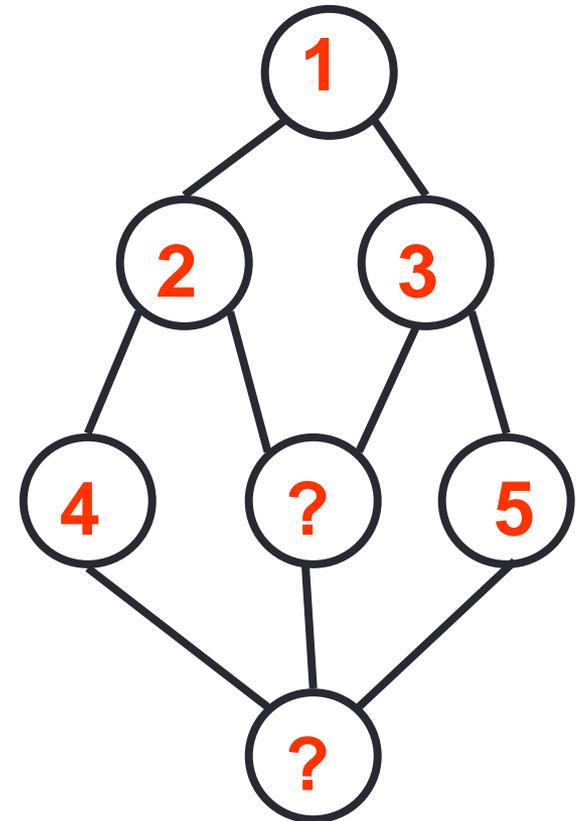

Right to left

Random

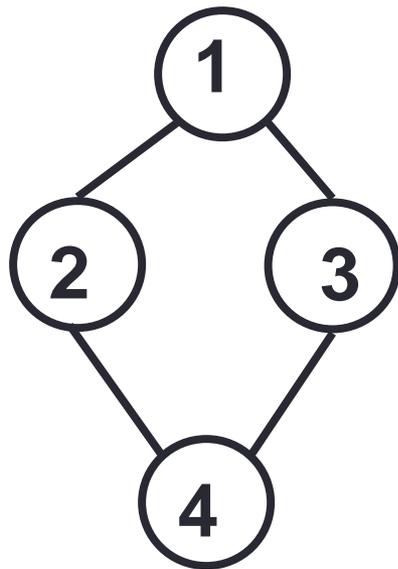

Traversal Algorithms

- Issue
 - How to avoid revisiting nodes
 - Infinite loop if cycles present
- Approaches
 - Record set of visited nodes
 - Mark nodes as visited

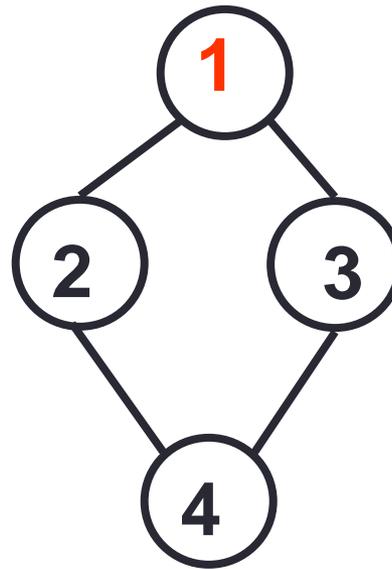

Traversal – Avoid Revisiting Nodes

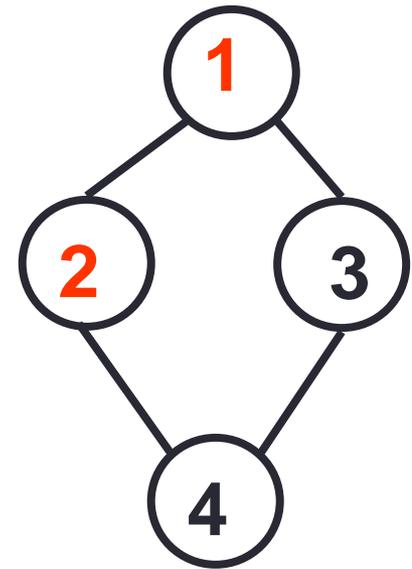

- Record set of visited nodes
 - Initialize { Visited } to empty set
 - Add to { Visited } as nodes are visited
 - Skip nodes already in { Visited }

$$V = \emptyset$$

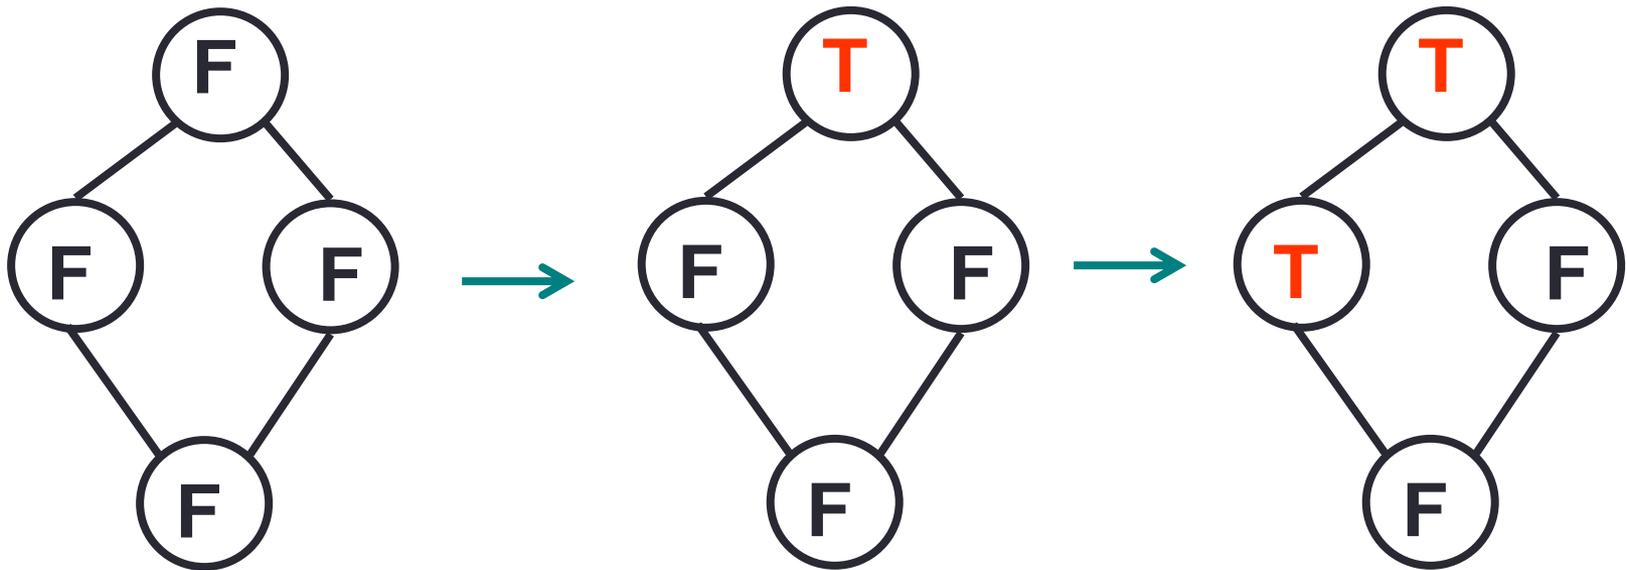

$$V = \{ 1 \}$$

$$V = \{ 1, 2 \}$$

Traversal – Avoid Revisiting Nodes

- Mark nodes as visited
 - Initialize tag on all nodes (to False)
 - Set tag (to True) as node is visited
 - Skip nodes with tag = True

Traversal Algorithm Using Sets

{ Visited } = \emptyset

{ Discovered } = { 1st node }

while ({ Discovered } $\neq \emptyset$)

 take node X out of { Discovered }

 if X not in { Visited }

 add X to { Visited }

process X (e.g., print)

 for each successor Y of X

 if (Y is not in { Visited })

 add Y to { Discovered }

BFS vs. DFS Traversal

- Order nodes taken out of { Discovered } key
- Implement { Discovered } as **Queue**
 - First in, first out
 - Traverse nodes breadth first
- Implement { Discovered } as **Stack**
 - First in, last out
 - Traverse nodes depth first

Example

- Let's do a BFS/DFS using the following graph (start vertex C)

- Which Java class can help us implement BFS/DFS?

Recursive Graph Traversal

- Can traverse graph using recursive algorithm
 - Recursively visit successors
- Approach
 - Visit (X)
 - for each successor Y of X
 - Visit (Y)
- Implicit call stack & backtracking
 - Results in depth-first traversal
