

Heaps

CMSC 132
Department of Computer Science
University of Maryland, College Park

Overview

- **Heap Properties**
- **Heap Operations**
- **Heap Implementation**
- **Heap Application – Heapsort**
- **Priority Queue**

Heaps

■ Two key properties

- Heap shape

- Value at node

 - Smaller than or equal to values in subtrees

■ Example heap

- $X \leq Y$

- $X \leq Z$

Heap & Non-heap Examples

Heaps

Non-heaps

Heap Properties

■ Key operations

- insert (X)
- getSmallest ()

■ Key applications

- Heapsort
- Priority queue

Heap Operations – Insert(X)

■ Algorithm

- Add X to end of tree
- While (X < parent)
 - Swap X with parent // X bubbles up tree

■ Complexity

- # of swaps proportional to height of tree
- $O(\log(n))$

Heap Insert Example

■ Insert (20)

1) Insert to
end of tree

2) Compare to parent,
swap if parent key larger

3) Insert
complete

Heap Insert Example

■ Insert (8)

1) Insert to
end of tree

2) Compare to parent,
swap if parent key larger

3) Insert
complete

Heap Operation – getSmallest()

■ Algorithm

- Get smallest node at root
- Replace root with X at end of tree
- While ($X > \text{child}$)
 - Swap X with smallest child // X drops down tree
- Return smallest node

■ Complexity

- # swaps proportional to height of tree
- $O(\log(n))$

Heap GetSmallest Example

■ getSmallest ()

1) Replace root
with end of tree

2) Compare node to
children, if larger swap
with smallest child

3) Repeat swap
if needed

Heap GetSmallest Example

■ getSmallest ()

1) Replace root
with end of tree

2) Compare node to
children, if larger swap
with smallest child

3) Repeat swap
if needed

Heap Implementation

- Can implement heap as array
 - Store nodes in array elements
 - Assign location (index) for elements using formula

(a) Heap represented as a tree

(b) Heap represented as an array

Heap Implementation

■ Observations

- Compact representation
- Edges are implicit (no storage required)
- Works well for complete trees (no wasted space)

Heap Implementation

■ Calculating node locations

- Array index i starts at 0
- $\text{Parent}(i) = \lfloor (i - 1) / 2 \rfloor$
- $\text{LeftChild}(i) = 2 \times i + 1$
- $\text{RightChild}(i) = 2 \times i + 2$

Heap Implementation

■ Example

- $\text{Parent}(1) = \lfloor (1 - 1) / 2 \rfloor = \lfloor 0 / 2 \rfloor = 0$
- $\text{Parent}(2) = \lfloor (2 - 1) / 2 \rfloor = \lfloor 1 / 2 \rfloor = 0$
- $\text{Parent}(3) = \lfloor (3 - 1) / 2 \rfloor = \lfloor 2 / 2 \rfloor = 1$
- $\text{Parent}(4) = \lfloor (4 - 1) / 2 \rfloor = \lfloor 3 / 2 \rfloor = 1$
- $\text{Parent}(5) = \lfloor (5 - 1) / 2 \rfloor = \lfloor 4 / 2 \rfloor = 2$

Heap Implementation

■ Example

- $\text{LeftChild}(0) = 2 \times 0 + 1 = 1$
- $\text{LeftChild}(1) = 2 \times 1 + 1 = 3$
- $\text{LeftChild}(2) = 2 \times 2 + 1 = 5$

Heap Implementation

■ Example

- $\text{RightChild}(0) = 2 \times 0 + 2 = 2$
- $\text{RightChild}(1) = 2 \times 1 + 2 = 4$

Heap Application – Heapsort

- **Use heaps to sort values**
 - Heap keeps track of smallest element in heap
- **Algorithm**
 - Create heap
 - Insert values in heap
 - Remove values from heap (in ascending order)
- **Complexity**
 - $O(n \log(n))$

Heapsort Example

- **Input**
 - 11, 5, 13, 6, 1
- **View heap during insert, removal**
 - As tree
 - As array

Heapsort – Insert Values

(a) Insert 11

11

(b) Insert 5

(c) Rebuild heap

(d) Insert 13

(e) Insert 6

(f) Rebuild heap

(g) Insert 1

(h) Rebuild heap

Heapsort – Remove Values

Heapsort – Insert in to Array 1

■ Input

■ 11, 5, 13, 6, 1

Index = 0 1 2 3 4

Insert 11

11				
----	--	--	--	--

Heapsort – Insert in to Array 2

■ Input

■ 11, 5, 13, 6, 1

Index = 0 1 2 3 4

Insert 5

11	5			
----	---	--	--	--

Swap

5	11			
---	----	--	--	--

Heapsort – Insert in to Array 3

■ Input

■ 11, 5, 13, 6, 1

Index =	0	1	2	3	4
Insert 13	5	11	13		

Heapsort – Insert in to Array 4

■ Input

■ 11, 5, 13, 6, 1

Index = 0 1 2 3 4

Insert 6

5	11	13	6	
---	----	----	---	--

Swap

5	6	13	11	
---	---	----	----	--

...

Heapsort – Remove from Array 1

■ Input

■ 11, 5, 13, 6, 1

Index = 0 1 2 3 4

Remove root

1	5	13	11	6
---	---	----	----	---

Replace

6	5	13	11	
---	---	----	----	--

Swap w/ child

5	6	13	11	
---	---	----	----	--

Heapsort – Remove from Array 2

■ Input

■ 11, 5, 13, 6, 1

Index = 0 1 2 3 4

Remove root

5	6	13	11	
---	---	----	----	--

Replace

11	6	13		
----	---	----	--	--

Swap w/ child

6	11	13		
---	----	----	--	--

Heap Application – Priority Queue

■ Queue

- Linear data structure
- First-in First-out (FIFO)
- Implement as array / linked list

Enqueue

Dequeue

■ Priority queue

- Elements are assigned **priority** value
- Higher priority elements are taken out first
- Equal priority elements are taken out in arbitrary order
- Implement as heap

Priority Queue

■ Properties

- Lower value = higher priority
- Heap keeps highest priority items in front

■ Complexity

- Enqueue (insert) = $O(\log(n))$
- Dequeue (remove) = $O(\log(n))$
- For any heap

Heap vs. Binary Search Tree

■ Binary search tree

- Keeps values in sorted order
- Find any value
 - $O(\log(n))$ for balanced tree
 - $O(n)$ for degenerate tree (worst case)

■ Heap

- Keeps smaller values in front
- Find **minimum** value
 - $O(\log(n))$ for any heap
- Can also organize heap to find **maximum** value
 - Keep largest value in front
