CMSC 132: OBJECT-ORIENTED PROGRAMMING II

Threads in Java

Department of Computer Science
University of Maryland, College Park

Problem

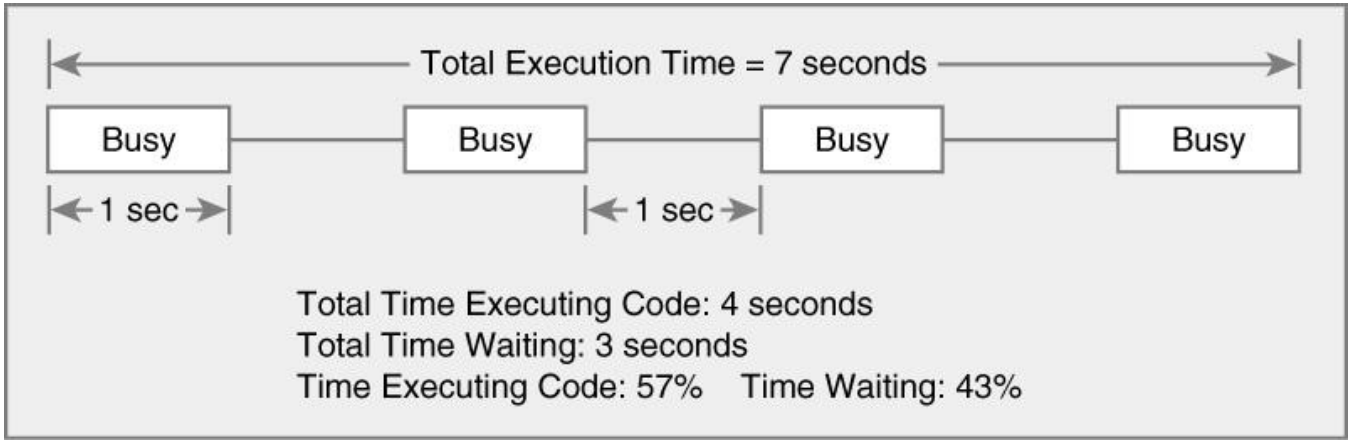
- Multiple tasks for computer
  - Draw & display images on screen
  - Check keyboard & mouse input
  - Send & receive data on network
  - Read & write files to disk
  - Perform useful computation (editor, browser, game)
- How does computer do everything at once?
  - Multitasking
  - Multiprocessing

Multitasking (Time-Sharing)

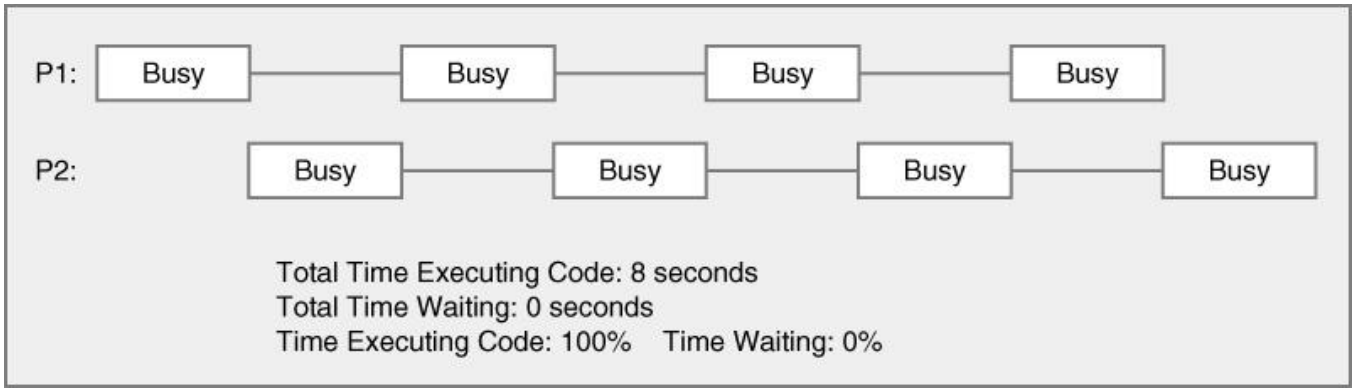
- Approach
  - Computer does some work on a task
  - Computer then quickly switch to next task
  - Tasks managed by operating system (scheduler)
- Computer seems to work on tasks concurrently
- Can improve performance by reducing waiting

Multitasking Can Aid Performance

- Single task



- Two tasks



Multiprocessing (Multithreading)

- Approach
  - Multiple processing units (multiprocessor)
  - Computer works on several tasks in parallel
  - Performance can be improved

Dual-core AMD Athlon X2

32 processor Pentium Xeon

4096 processor Cray X1

Beowulf computer cluster (Borg, 52-node cluster used by McGill University Image/Info from Wikipedia)

Perform Multiple Tasks Using Processes

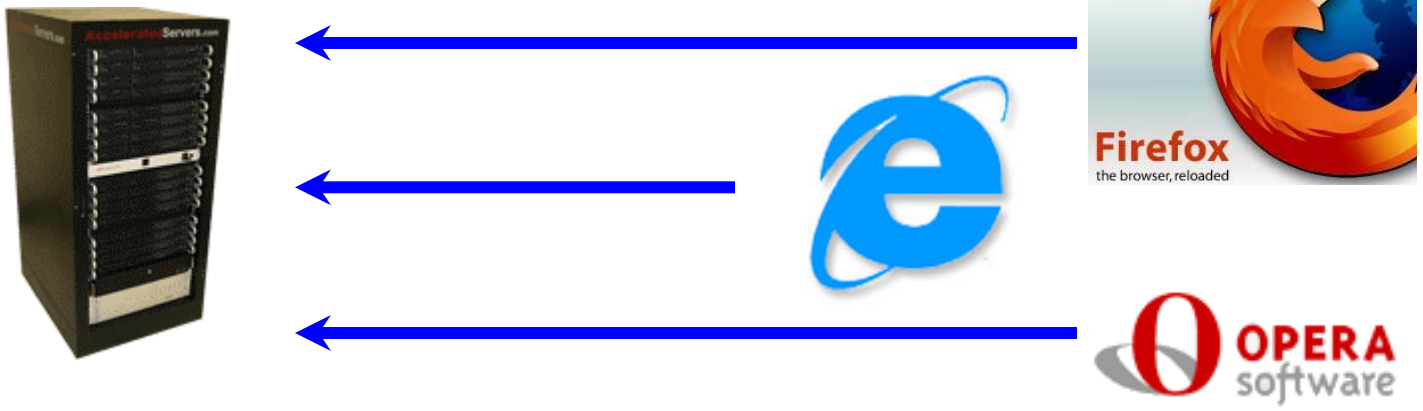
- Process
  - Definition → executable program loaded in memory
  - Has own address space
    - Variables & data structures (in memory)
  - Each process may execute a different program
  - Communicate via operating system, files, network
  - May contain multiple threads

Perform Multiple Tasks Using Threads

- Thread
  - Definition → sequentially executed stream of instructions
  - Has own execution context
    - Program counter, call stack (local variables)
  - Communicate via shared access to data
  - Also known as “lightweight process”
  - Let’s see how memory is organized for a threaded environment
  - Diagram
    - http://blog.codecentric.de/wp-content/uploads/2009/12/java-memory-architecture.jpg

Motivation for Multithreading

- Captures logical structure of problem
  - May have concurrent interacting components
  - Can handle each component using separate thread
  - Simplifies programming for problem
- Example



Web Server uses threads to handle …

Multiple simultaneous web browser requests

Motivation for Multithreading

- Better utilize hardware resources
  - When a thread is delayed, compute other threads
  - Given extra hardware, compute threads in parallel
  - Reduce overall execution time
- Example

Multiple simultaneous web browser requests…

Handled faster by multiple web servers

Programming with Threads

- Concurrent programming
  - Writing programs divided into independent tasks
  - Tasks may be executed in parallel on multiprocessors

- Multithreading
  - Executing program with multiple threads in parallel
  - Special form of multiprocessing

Creating Threads in Java

- Two approaches to create threads
  - Extending Thread class (**NOT RECOMMENDED**)
  - Runnable interface approach (**PREFERED**)
- Approach 1: Extending Thread class
  - We overload the Thread class run() method
  - The run() methods defines the actual task the thread performs
  - Example

```
public class MyT extends Thread {
    public void run( ) {
        …                       // work for thread
    }
}
MyT t = new MyT( ) ;    // create thread
t.start( );             // begin running thread
…                       // thread executing in parallel
```

- **Example:** message, messageThreadExtends packages

Creating Threads in Java

- Approach 2: Runnable Interface
  - Define a class (worker) that implements the Runnable interface

```
public interface Runnable {
    public void run();   // work done by thread
}
```

  - Create thread to execute the run() method
    - Alternative 1: Create thread object and pass worker object to Thread constructor
    - Alternative 2: Hand worker object to an executor
  - Example

```
public class Worker implements Runnable {
    public void run( )  { // work for thread }
}
Thread t = new Thread(new Worker( ));  // create thread
t.start();                             // begin running thread
…                                      // thread executing in parallel
```

- **Example:** message, messageThreadRunnable packages

Why Extending Thread Approach Not Recommended?

- Not a big problem for getting started
  - But a bad habit for industrial strength development
- Methods of worker and Thread class intermixed
- Hard to migrate to more efficient approaches
  - Thread Pools

Thread Class

```
public class Thread extends Object implements Runnable {
    public Thread();
    public Thread(String name);   // Thread name
    public Thread(Runnable R);
    public Thread(Runnable R, String name);

    public void run();     // if no R, work for thread
    public void start();   // thread gets in line so it eventually it can run
    ...
}
```

More Thread Class Methods

```
public class Thread extends Object {
    …
    public static Thread currentThread()
    public String getName()
    public void interrupt()  // alternative to stop (deprecated)
    public boolean isAlive()
    public void join()
    public void setDaemon()
    public void setName()
    public void setPriority()
    public static void sleep()
    public static void yield()
}
```

Creating Threads in Java

- Note
  - Thread eventually starts executing only if start() is called

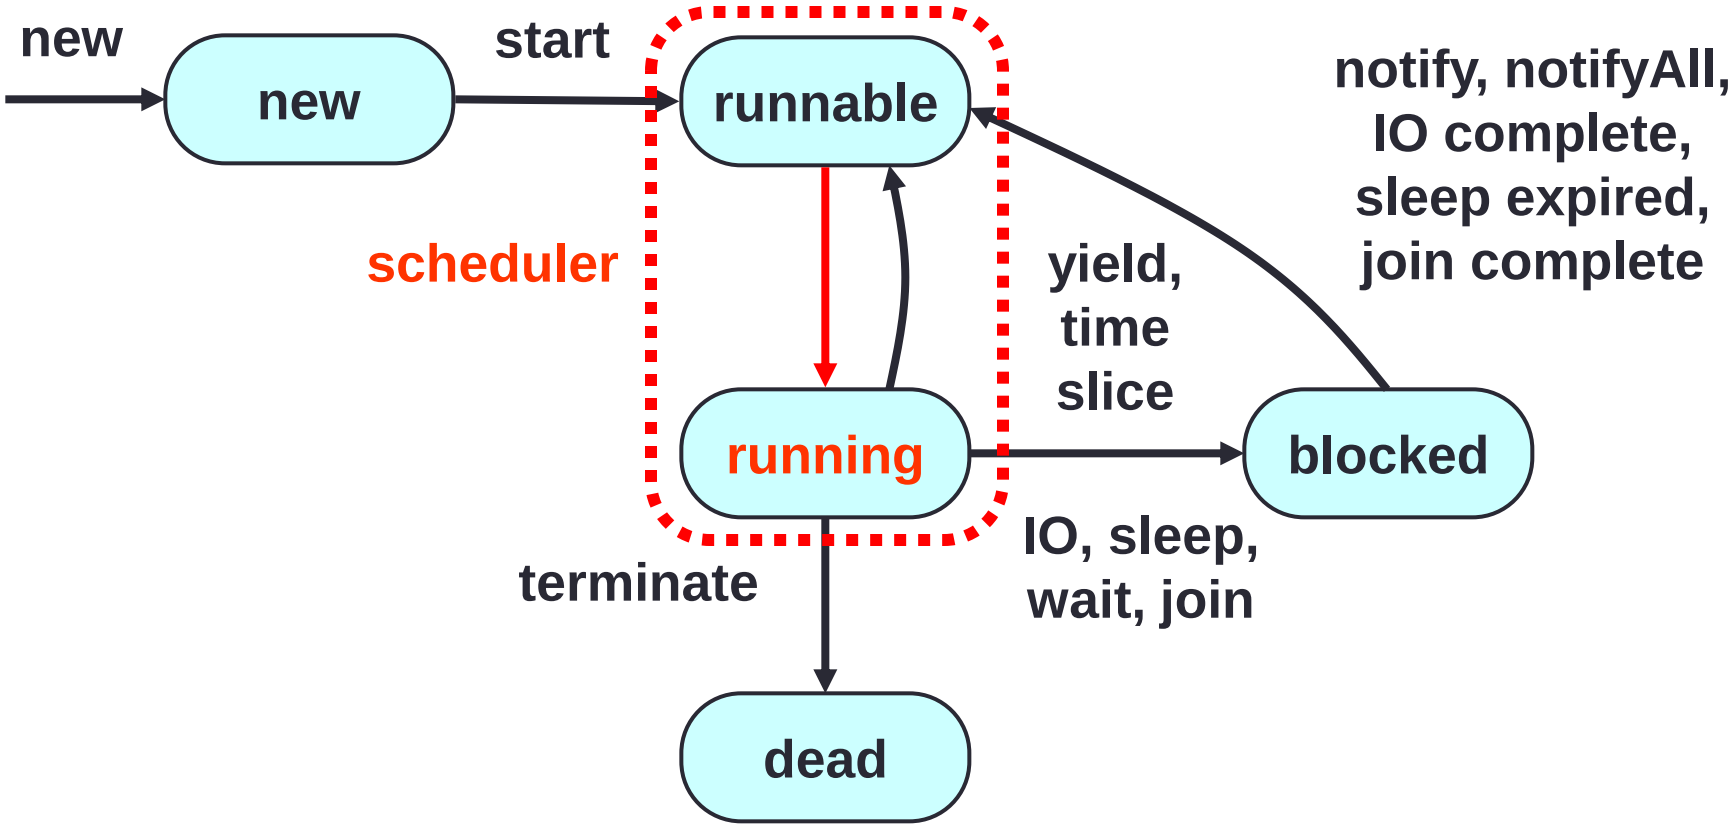
  - Runnable is interface
    - So it can be implemented by any class
    - Required for multithreading in applets
  - Do not call the run method directly

Threads – Thread States

- Java thread can be in one of these states
  - New → thread allocated & waiting for start()
  - Runnable → thread can begin execution
  - Running → thread currently executing
  - Blocked → thread waiting for event (I/O, etc.)
  - Dead → thread finished
- Transitions between states caused by
  - Invoking methods in class Thread
    - new(), start(), yield(), sleep(), wait(), notify()…
  - Other (external) events
    - Scheduler, I/O, returning from run()…
- In Java states defined by Thread.State
  - http://docs.oracle.com/javase/6/docs/api/java/lang/Thread.State.html

Threads – Thread States

- State diagram



Running is a logical state → indicates runnable thread is actually running
