## 12.1 Trees

### 12.1.1 Binary Tree

A binary tree is a tree data structure in which each node has at most two children, which are referred to as the left child and the right child.

- Tree Traversal: tree traversal refers to the process of visiting (examining and/or updating) each node in a tree data structure, exactly once, in a systematic way.
  - preOrder:root, left child, right child: A,B,D,C,E,G,G,H,I
  - inOrder: left child, root, right child : B,D,A,G,E,C,H,F,I
  - postOrder:left child, right child, root: D,B,G,E,H,I,F,C,A
  - levelOrder:A,B,C,D,E,F,G,G,I
