

$$G = \{B_{u,u}, C_{u,v}\} \quad A_{u,v}$$

$$C = \{c(se_1$$

$$C = \{X \quad X\} \quad C$$

The construction encodes each node u in the initial CFL graph G

Constraints	New Constraint
-------------	----------------

4.2 Complexity

```
int main(void)
{
    tainted int x1;
    int z1, x2;
    untainted int z2;
    z1 = id(x1); // call site 1
    z2 = id(x2); // call site 2
}
```

is one wrinkle, however: the \rangle_i edges that form P paths are represented as projections in the constraint system. There is no term representation of a \rangle_i edge as there is with a \langle_i edge. The solution is straightforward: we simply add a term representation for these edges. We modify the reduction so that

$$y$$
