P and EXP

Def

- 1. $P = DTIME(n^{O(1)}).$
- 2. EXP = DTIME($2^{n^{O(1)}}$).
- 3. PF is the set of functions that are computable in poly time.

▲□▶ ▲□▶ ▲目▶ ▲目▶ 三日 - のへで

Def A is in NP if there exists a set $B \in P$ and a polynomial p such that

$$A = \{x \mid (\exists y)[|y| = p(|x|) \land (x, y) \in B]\}.$$

Def A is in NP if there exists a set $B \in P$ and a polynomial p such that

$$A = \{x \mid (\exists y)[|y| = p(|x|) \land (x, y) \in B]\}.$$

Intuition. Let $A \in NP$.

If x ∈ A then there is a SHORT (poly in |x|) proof of this fact, namely y, such that x can be VERIFIED in poly time. So if I wanted to convince you that x ∈ L, I could give you y. You can verify (x, y) ∈ B easily and be convinced.

Do we think $CLIQ \in P$? No—we will later see its NP-complete. Note CLIQ only asks if **there exists** a *k*-cliq. It is not asking to **find one** or **find the size of the largest clique.**

NCLIQ(G) is the size of largest clique. It's a function, not a set.

▲□▶ ▲□▶ ▲ 臣▶ ▲ 臣▶ ― 臣 … のへぐ

NCLIQ(G) is the size of largest clique. It's a function, not a set. We show $CLIQ \in P$ implies $NCLIQ \in PF$.

NCLIQ(G) is the size of largest clique. It's a function, not a set. We show $CLIQ \in P$ implies $NCLIQ \in PF$.

We know $1 \leq \text{NCLIQ}(G) \leq n$.

NCLIQ(G) is the size of largest clique. It's a function, not a set. We show $CLIQ \in P$ implies $NCLIQ \in PF$.

We know $1 \leq \text{NCLIQ}(G) \leq n$.

By asking CLIQ we do binary search to find k such that $(G, k) \in \text{CLIQ}$ and $(G, k + 1) \notin \text{CLIQ}$. Hence NCLIQ(G) = k.

NCLIQ(G) is the size of largest clique. It's a function, not a set. We show $CLIQ \in P$ implies $NCLIQ \in PF$.

We know $1 \leq \text{NCLIQ}(G) \leq n$.

By asking CLIQ we do binary search to find k such that $(G, k) \in \text{CLIQ}$ and $(G, k + 1) \notin \text{CLIQ}$. Hence NCLIQ(G) = k.

This algorithm took log n queries to CLIQ.

FCLIQ(G) returns largest clique. It's a function, not a set.

FCLIQ(G) returns largest clique. It's a function, not a set. We show $CLIQ \in P$ implies $FCLIQ \in PF$.

FCLIQ(G) returns largest clique. It's a function, not a set. We show $CLIQ \in P$ implies $FCLIQ \in PF$. Algorithm that will, given (G, k), return a clique of size k OR say NO there isn't one.

 $\operatorname{FCLIQ}(G)$ returns largest clique. It's a function, not a set.

We show $CLIQ \in P$ implies $FCLIQ \in PF$.

Algorithm that will, given (G, k), return a clique of size k OR say NO there isn't one.

HELPFCLIQ:

- 1. Input (G, k)
- 2. Reduce the problem as follows: Let v be a vertex. Let $G' = G \{v\}$. Test $(G', k) \in CLIQ$.
 - ▶ If YES then find HELPFCLIQ(G', k) since we don't need v.

If NO then find A = HELPFCLIQ(G', k − 1) and return A ∪ {v} since we know we NEED v.

Finishing Up CLIQ and FCLIQ

FCLIQ:

- 1. Input G
- 2. Find k = NCLIQ(G).
- 3. Call HELPFCLIQ(G, k).

▲□▶ ▲圖▶ ▲ 臣▶ ▲ 臣▶ ― 臣 … のへで
Other Set–Function Issues

In the problems we will look at, the SET version (e.g., CLIQ) can always be used to find the FUNCTION version (e.g., FCLIQ).

We will not discuss this anymore in class, though it may be on some HWs.

 $HAM = \{G : G \text{ has a Hamiltonian Cycle } \}$

A cycle is Hamiltonian (HAM) if it visits every vertex once.

- 1. *y* is the cycle itself.
- 2. $B = \{(G, C) : C \text{ is a HAM cycle of } G\}$

 $HAM = \{ G : G \text{ has a Hamiltonian Cycle } \}$

▲□▶ ▲□▶ ▲三▶ ▲三▶ 三三 のへぐ

1850? Hamilton poses, in modern terms, the question of characterizing when graphs are HAM.

Note Mathematicians wanted a characterization of HAM graphs similar to the characterization of EUL graphs.

They didn't have the language of algorithms to state what they wanted more rigorously.

1736 Euler solves the Konigsberg bridge problem by proving, in modern terms,

A graph is EUL iff every vertex has even degree

1850? Hamilton poses, in modern terms, the question of characterizing when graphs are HAM.

Note Mathematicians wanted a characterization of HAM graphs similar to the characterization of EUL graphs.

They didn't have the language of algorithms to state what they wanted more rigorously.

The theory of NP-completeness enabled mathematicians to state what they wanted rigorously $(HAM \in P)$ and also gave the basis for proving likely it cannot be done (since HAM is NP-Complete).

Examples of Sets in NP: ShortPath

 $\mathrm{SP} = \{(G, v_1, v_2, c): \text{ there is a path } v_1 \rightarrow v_2 \text{ in } G \text{ of length} \leq c\}$

- 1. y is the path itself.
- 2. $B = \{((G, v_1, v_2, c), p) :$ $p \text{ is a path in } G \text{ from } v_1 \text{ to } v_2 \text{ with } \leq c \text{ edges} \}$

Examples of Sets in NP: ShortPath

Thm Define language Y via:

$$Y = \left\{ \langle M, x, 1^t \rangle \mid \begin{array}{c} M \text{ is a non-deterministic T.M.} \\ \text{which accepts } x \text{ within } t \text{ steps} \end{array} \right\}.$$

Then Y is NP-complete.

Not that interesting since Y is not a natural set.

We define several variants of SAT:

We define several variants of SAT:

1. SAT is the set of all boolean formulas that are satisfiable.

▲□▶ ▲□▶ ▲ 臣▶ ▲ 臣▶ ― 臣 … のへぐ

We define several variants of SAT:

1. SAT is the set of all boolean formulas that are satisfiable. That is, $\phi(\vec{x}) \in SAT$ if there exists a vector \vec{b} such that $\phi(\vec{b}) = TRUE$.

We define several variants of SAT:

- 1. SAT is the set of all boolean formulas that are satisfiable. That is, $\phi(\vec{x}) \in SAT$ if there exists a vector \vec{b} such that $\phi(\vec{b}) = TRUE$.
- 2. CNFSAT is the set of all boolean formulas in SAT of the form $C_1 \land \cdots \land C_m$ where each C_i is an \lor of literals.

In 1971 Stephen Cook and Leonid Levin Independently showed: **CNF-SAT is NP-complete**

Thoughts on this:

In 1971 Stephen Cook and Leonid Levin Independently showed: **CNF-SAT is NP-complete**

Thoughts on this:

1. The proof is not hard, but it involves looking at actual TMs. We will prove it next lecture. SAT was the **first** NP-complete problem. You could not use some other problem.

In 1971 Stephen Cook and Leonid Levin Independently showed: **CNF-SAT is NP-complete**

Thoughts on this:

- 1. The proof is not hard, but it involves looking at actual TMs. We will prove it next lecture. SAT was the **first** NP-complete problem. You could not use some other problem.
- 2. Once we have SAT is NP-complete we will NEVER use TMs again. To show Y NP-complete: (1) $Y \in NP$, (2) SAT $\leq Y$.
