

# Classical Crypto, Modern Crypto, and Why Number Theory is Important

June 12, 2020

# Two Classic Ciphers: Vigenère and Matrix

June 12, 2020

# The Vigenère cipher

**Key:** A word or phrase. Example:  $dog = (3,14,6)$ .

Easy to remember and transmit.

**Example** using *dog*.

Shift 1st letter by 3

Shift 2nd letter by 14

Shift 3rd letter by 6

Shift 4th letter by 3

Shift 5th letter by 14

Shift 6th letter by 6, etc.

*Jacob Prinz is a Physics Major*

*Jacob Prinz isaPhysics Major*

encrypts to

*MOIRP VUWTC WYDDN BGOFG SDXUU*

# The Vigenère cipher

**Key:**  $k = (k_1, k_2, \dots, k_n)$ .

**Encrypt** (all arithmetic is mod 26)

$$\text{Enc}(m_1, m_2, \dots, m_N) =$$

$$m_1 + k_1, m_2 + k_2, \dots, m_n + k_n,$$

$$m_{n+1} + k_1, m_{n+2} + k_2, \dots, m_{n+n} + k_n,$$

...

**Decrypt** Decryption just reverse the process

# The Vigenère cipher

- ▶ Size of key space?
  - ▶ If keys are 14-char then key space size  $26^{14} \approx 2^{66}$
  - ▶ If variable length keys, even more.
  - ▶ Brute-force search infeasible
- ▶ Is the Vigenère cipher secure?
- ▶ Believed secure for many years. . .
- ▶ Might not have even been secure. . .
- ▶ Easily cracked by 1900. Prob much earlier.

# The Matrix Cipher

**Definition:** Matrix Cipher. Pick  $M$  a  $2 \times 2$  matrix.

1. Encrypt via  $xy \rightarrow M(xy)$ .
2. Decrypt via  $xy \rightarrow M^{-1}(xy)$

**Encode:** Break  $T$  into blocks of 2, apply  $M$  to each pair.

**Decode:** Do the same only with  $M^{-1}$ . Need  $M^{-1}$  to exist. It does if  $\det$  is rel prime to 26.

# The Matrix Cipher

$$M = \begin{pmatrix} a & b \\ c & d \end{pmatrix}$$

## Good News:

1. Can test if  $M^{-1}$  exists, and is so find it, easily.
2.  $M$  small, so Key small.
3. Applying  $M$  or  $M^{-1}$  to a vector is easy computationally.

## Bad News:

1. Eve CAN crack using frequencies of pairs of letters.
2. Eve CAN crack – Key space has  $< 26^4 = 456976$ . Small.

So what to do?

Use bigger matrix!

# Is Matrix Cipher Uncrackable?

Use  $n \times n$  matrix for large  $n$ . Say 50. Still quite feasible for Alice and Bob.

**VOTE:** Yes, No, Unknown to Science, Other.

# Is Matrix Cipher Uncrackable?

Use  $n \times n$  matrix for large  $n$ . Say 50. Still quite feasible for Alice and Bob.

**VOTE:** Yes, No, Unknown to Science, Other.

1. If Eve just has ciphertext then brute force needs of  $26^{n^2}$  possibilities. Can get that down to  $26^n$ .

# Is Matrix Cipher Uncrackable?

Use  $n \times n$  matrix for large  $n$ . Say 50. Still quite feasible for Alice and Bob.

**VOTE:** Yes, No, Unknown to Science, Other.

1. If Eve just has ciphertext then brute force needs of  $26^{n^2}$  possibilities. Can get that down to  $26^n$ .
2.  $26^n$  is still large. Can Eve do better?

# Is Matrix Cipher Uncrackable?

Use  $n \times n$  matrix for large  $n$ . Say 50. Still quite feasible for Alice and Bob.

**VOTE:** Yes, No, Unknown to Science, Other.

1. If Eve just has ciphertext then brute force needs of  $26^{n^2}$  possibilities. Can get that down to  $26^n$ .
2.  $26^n$  is still large. Can Eve do better?  
Seems to be **Unknown to Science!**

# Is Matrix Cipher Uncrackable?

Use  $n \times n$  matrix for large  $n$ . Say 50. Still quite feasible for Alice and Bob.

**VOTE:** Yes, No, Unknown to Science, Other.

1. If Eve just has ciphertext then brute force needs of  $26^{n^2}$  possibilities. Can get that down to  $26^n$ .
2.  $26^n$  is still large. Can Eve do better?  
Seems to be **Unknown to Science!**  
**So why is it not used?** Discuss!

# Is Matrix Cipher Uncrackable?

Use  $n \times n$  matrix for large  $n$ . Say 50. Still quite feasible for Alice and Bob.

**VOTE:** Yes, No, Unknown to Science, Other.

1. If Eve just has ciphertext then brute force needs of  $26^{n^2}$  possibilities. Can get that down to  $26^n$ .
2.  $26^n$  is still large. Can Eve do better?  
Seems to be **Unknown to Science!**  
**So why is it not used?** Discuss!
3. In reality Eve has prior messages and what they coded to, so from that she can easily crack it. (Next Slide.) **That is why not used.**

# Cracking Matrix Cipher

Example using  $2 \times 2$  Matrix Cipher.

Eve learns that  $(19,8)$  encrypts to  $(3,9)$ . Hence:

$$\begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} 19 \\ 8 \end{pmatrix} = \begin{pmatrix} 3 \\ 9 \end{pmatrix}$$

So

$$19a + 8b = 3$$

$$19c + 8d = 9$$

**Two linear equations, Four variables**

# Cracking Matrix Cipher

Example using  $2 \times 2$  Matrix Cipher.

Eve learns that (19,8) encrypts to (3,9). Hence:

$$\begin{pmatrix} a & b \\ c & d \end{pmatrix} \begin{pmatrix} 19 \\ 8 \end{pmatrix} = \begin{pmatrix} 3 \\ 9 \end{pmatrix}$$

So

$$19a + 8b = 3$$

$$19c + 8d = 9$$

**Two linear equations, Four variables**

If Eve learns one more 2-letter message decoding then she will have

**Four linear equations, Four variables**

which she can solve! Yeah? Boo? Depends whose side you are on.

# Public Key Crypto: Math Needed and DH

# Private-Key Ciphers

What do the following **Private Key Encryption Schemes** all have in common:

1. Shift Cipher
2. Affine Cipher
3. Vig Cipher
4. General Sub
5. Matrix Cipher
6. One-Time Pad (this is uncrackable! but hard to use).

Alice and Bob need to **meet!** (Hence **Private Key**.)

Can Alice and Bob to establish a key without meeting?

# Private-Key Ciphers

What do the following **Private Key Encryption Schemes** all have in common:

1. Shift Cipher
2. Affine Cipher
3. Vig Cipher
4. General Sub
5. Matrix Cipher
6. One-Time Pad (this is uncrackable! but hard to use).

Alice and Bob need to **meet!** (Hence **Private Key**.)

Can Alice and Bob to establish a key without meeting?

**Yes!** And that is the key to public-key cryptography.

# Private-Key Ciphers

What do the following **Private Key Encryption Schemes** all have in common:

1. Shift Cipher
2. Affine Cipher
3. Vig Cipher
4. General Sub
5. Matrix Cipher
6. One-Time Pad (this is uncrackable! but hard to use).

Alice and Bob need to **meet!** (Hence **Private Key**.)

Can Alice and Bob to establish a key without meeting?

**Yes!** And that is the key to public-key cryptography.

**And** Public Key Crypto is the Key to Modern Cryptography.

# Math Needed for Diffie-Helman

# Notation

Let  $p$  be a prime.

1.  $\mathbb{Z}_p$  is the numbers  $\{0, \dots, p - 1\}$  with modular addition and multiplication.
2.  $\mathbb{Z}_p^*$  is the numbers  $\{1, \dots, p - 1\}$  with modular multiplication.

# Exponentiation mod $p$

## Example of a Good Algorithm

Want  $3^{64} \pmod{101}$ . All arithmetic is mod 101.

$$x_0 = 3$$

$$x_1 = x_0^2 \equiv 9 \text{ This is } 3^2.$$

$$x_2 = x_1^2 \equiv 9^2 \equiv 81. \text{ This is } 3^4.$$

$$x_3 = x_2^2 \equiv 81^2 \equiv 97. \text{ This is } 3^8.$$

$$x_4 = x_3^2 \equiv 97^2 \equiv 16. \text{ This is } 3^{16}.$$

$$x_5 = x_4^2 \equiv 16^2 \equiv 54. \text{ This is } 3^{32}.$$

$$x_6 = x_5^2 \equiv 54^2 \equiv 88. \text{ This is } 3^{64}.$$

So in 6 steps we got the answer!

# Exponentiation mod $p$

## Example of a Good Algorithm

Want  $3^{64} \pmod{101}$ . All arithmetic is mod 101.

$$x_0 = 3$$

$$x_1 = x_0^2 \equiv 9 \text{ This is } 3^2.$$

$$x_2 = x_1^2 \equiv 9^2 \equiv 81. \text{ This is } 3^4.$$

$$x_3 = x_2^2 \equiv 81^2 \equiv 97. \text{ This is } 3^8.$$

$$x_4 = x_3^2 \equiv 97^2 \equiv 16. \text{ This is } 3^{16}.$$

$$x_5 = x_4^2 \equiv 16^2 \equiv 54. \text{ This is } 3^{32}.$$

$$x_6 = x_5^2 \equiv 54^2 \equiv 88. \text{ This is } 3^{64}.$$

So in 6 steps we got the answer!

**Generalize** Repeated squaring Alg for  $a^n \pmod{p}$ , even if  $n$  is not a power of 2.

# Exponentiation mod $p$

## Example of a Good Algorithm

Want  $3^{64} \pmod{101}$ . All arithmetic is mod 101.

$$x_0 = 3$$

$$x_1 = x_0^2 \equiv 9 \text{ This is } 3^2.$$

$$x_2 = x_1^2 \equiv 9^2 \equiv 81. \text{ This is } 3^4.$$

$$x_5 = x_4^2 \equiv 16^2 \equiv 54. \text{ This is } 3^{32}.$$

$$x_6 = x_5^2 \equiv 54^2 \equiv 88. \text{ This is } 3^{64}.$$

So in 6 steps we got the answer!

**Generalize** Repeated squaring Alg for  $a^n \pmod{p}$ , even if  $n$  is not a power of 2.

**How many steps?**  $\lg n$ . Fast!

# Diffie-Helman Key Exchange

## Generators mod $p$

Lets take powers of 3 mod 7. All arithmetic is mod 7.

$$3^0 \equiv 1$$

$$3^1 \equiv 3$$

$$3^2 \equiv 3 \times 3^1 \equiv 9 \equiv 2$$

$$3^3 \equiv 3 \times 3^2 \equiv 3 \times 2 \equiv 6$$

$$3^4 \equiv 3 \times 3^3 \equiv 3 \times 6 \equiv 18 \equiv 4$$

$$3^5 \equiv 3 \times 3^4 \equiv 3 \times 4 \equiv 12 \equiv 5$$

$$3^6 \equiv 3 \times 3^5 \equiv 3 \times 5 \equiv 15 \equiv 1$$

$$\{3^0, 3^1, 3^2, 3^3, 3^4, 3^5, 3^6\} = \{1, 2, 3, 4, 5, 6\} \text{ Not in order}$$

## Generators mod $p$

Lets take powers of 3 mod 7. All arithmetic is mod 7.

$$3^0 \equiv 1$$

$$3^1 \equiv 3$$

$$3^2 \equiv 3 \times 3^1 \equiv 9 \equiv 2$$

$$3^3 \equiv 3 \times 3^2 \equiv 3 \times 2 \equiv 6$$

$$3^4 \equiv 3 \times 3^3 \equiv 3 \times 6 \equiv 18 \equiv 4$$

$$3^5 \equiv 3 \times 3^4 \equiv 3 \times 4 \equiv 12 \equiv 5$$

$$3^6 \equiv 3 \times 3^5 \equiv 3 \times 5 \equiv 15 \equiv 1$$

$$\{3^0, 3^1, 3^2, 3^3, 3^4, 3^5, 3^6\} = \{1, 2, 3, 4, 5, 6\} \text{ Not in order}$$

3 is a **generator** for  $\mathbb{Z}_7$ .

## Generators mod $p$

Lets take powers of 3 mod 7. All arithmetic is mod 7.

$$3^0 \equiv 1$$

$$3^1 \equiv 3$$

$$3^2 \equiv 3 \times 3^1 \equiv 9 \equiv 2$$

$$3^3 \equiv 3 \times 3^2 \equiv 3 \times 2 \equiv 6$$

$$3^4 \equiv 3 \times 3^3 \equiv 3 \times 6 \equiv 18 \equiv 4$$

$$3^5 \equiv 3 \times 3^4 \equiv 3 \times 4 \equiv 12 \equiv 5$$

$$3^6 \equiv 3 \times 3^5 \equiv 3 \times 5 \equiv 15 \equiv 1$$

$$\{3^0, 3^1, 3^2, 3^3, 3^4, 3^5, 3^6\} = \{1, 2, 3, 4, 5, 6\} \text{ Not in order}$$

3 is a **generator** for  $\mathbb{Z}_7$ .

**Definition:** If  $p$  is a prime and

$\{g^0, g^1, \dots, g^{p-1}\} = \{1, \dots, p-1\}$  then  $g$  is a **generator** for  $\mathbb{Z}_p$ .

# Discrete Log-Example

**Fact:** 5 is a generator mod 73. All arithmetic is mod 73.

**Find  $x$  such that  $5^x \equiv 26$**

# Discrete Log-Example

**Fact:** 5 is a generator mod 73. All arithmetic is mod 73.

**Find  $x$  such that  $5^x \equiv 26$**

**I do not know the answer!**

# Discrete Log-Example

**Fact:** 5 is a generator mod 73. All arithmetic is mod 73.

**Find  $x$  such that  $5^x \equiv 26$**

**I do not know the answer!**

Could try computing  $5^3, 5^4, \dots$ , until you get 26.

Might take  $\sim 70$  steps.

# Discrete Log-General

**Definition** Let  $p$  be a prime and  $g$  be a generator mod  $p$ .

The **Discrete Log Problem** is:

given  $y$ , find  $x$  such that  $g^x = y$ .

1. If  $g, y \in \{\frac{p}{3}, \dots, \frac{2p}{3}\}$  then problem suspected hard.
2. Obv alg:  $O(p)$  steps. There is an  $O(\sqrt{p})$  alg. Still too slow.

# Consider What We Already Have Here

- ▶ Exponentiation is Easy.
- ▶ Discrete Log is thought to be Hard.

# Consider What We Already Have Here

- ▶ Exponentiation is Easy.
- ▶ Discrete Log is thought to be Hard.

Can we come up with a crypto system where Alice and Bob do Exponentiation to encrypt and decrypt, while Eve has to do Discrete Log to crack it?

# Consider What We Already Have Here

- ▶ Exponentiation is Easy.
- ▶ Discrete Log is thought to be Hard.

Can we come up with a crypto system where Alice and Bob do Exponentiation to encrypt and decrypt, while Eve has to do Discrete Log to crack it?

No. But we'll come close.

## Other Things Needed

Need Alice and Bob to be able to

1. Find Large Primes
2. Find generators for those primes.

Both are fast if done together:

Find  $p$  such that  $p$  prime AND  $\frac{p-1}{2}$  is prime.

Then finding generator is easy.

# The Diffie-Helman Key Exchange

Alice and Bob will share a secret  $s$ .  $n$  is sec param.

1. Alice finds a  $(p, g)$ ,  $p$  of length  $n$ ,  $g$  gen for  $\mathbb{Z}_p$ . Arith mod  $p$ .
2. Alice broadcasts  $(p, g, HAHA)$ .
3. Alice picks random  $a \in \{\frac{p}{3}, \dots, \frac{2p}{3}\}$ . Alice computes  $g^a$  and broadcasts  $(g^a, HAHA)$ .
4. Bob picks random  $b \in \{\frac{p}{3}, \dots, \frac{2p}{3}\}$ . Bob computes  $g^b$  and broadcasts  $(g^b, HAHA)$ .
5. Alice computes  $(g^b)^a = g^{ab}$ .
6. Bob computes  $(g^a)^b = g^{ab}$ .
7.  $g^{ab}$  is the shared secret.

# The Diffie-Helman Key Exchange

Alice and Bob will share a secret  $s$ .  $n$  is sec param.

1. Alice finds a  $(p, g)$ ,  $p$  of length  $n$ ,  $g$  gen for  $\mathbb{Z}_p$ . Arith mod  $p$ .
2. Alice broadcasts  $(p, g, HAHA)$ .
3. Alice picks random  $a \in \{\frac{p}{3}, \dots, \frac{2p}{3}\}$ . Alice computes  $g^a$  and broadcasts  $(g^a, HAHA)$ .
4. Bob picks random  $b \in \{\frac{p}{3}, \dots, \frac{2p}{3}\}$ . Bob computes  $g^b$  and broadcasts  $(g^b, HAHA)$ .
5. Alice computes  $(g^b)^a = g^{ab}$ .
6. Bob computes  $(g^a)^b = g^{ab}$ .
7.  $g^{ab}$  is the shared secret.

**PRO:** Alice and Bob can execute the protocol easily.

# The Diffie-Helman Key Exchange

Alice and Bob will share a secret  $s$ .  $n$  is sec param.

Sounds good but:

1. Clever number theory has lead to algorithms for Factoring with run times around  $2^{L^{1/3} \log(L)^{2/3}}$  where  $L$  is the Length of the number.
2. Some of these have been coded up and some work well on parallel machines.
3. NO. The NSA does not have brilliant Number theorists who have secret algorithms for factoring in P. They just use Facebook to track bad people. And good people.

# Where Are We Now?

1. If Discrete Log is hard then Diffie Helman is uncrackable.
2. If Factoring is hard then RSA is uncrackable.

Sounds good but:

1. Clever number theory has lead to algorithms for Factoring with run times around  $2^{L^{1/3} \log(L)^{2/3}}$  where  $L$  is the Length of the number.
2. Some of these have been coded up and some work well on parallel machines.
3. NO. The NSA does not have brilliant Number theorists who have secret algorithms for factoring in P. They just use Facebook to track bad people. And good people.
4. There are fast quantum algorithms. So far these are theoretical only.

# Where Are We Now?

1. If Discrete Log is hard then Diffie Helman is uncrackable.
2. If Factoring is hard then RSA is uncrackable.

Sounds good but:

1. Clever number theory has lead to algorithms for Factoring with run times around  $2^{L^{1/3} \log(L)^{2/3}}$  where  $L$  is the Length of the number.
2. Some of these have been coded up and some work well on parallel machines.
3. NO. The NSA does not have brilliant Number theorists who have secret algorithms for factoring in P. They just use Facebook to track bad people. And good people.
4. There are fast quantum algorithms. So far these are theoretical only.
5. Hence the need for crypto systems based on OTHER assumptions.

# One More Application that Needs Discrete Log Hard

## Yao's Millionaire's Problem

1. Donald has  $x$  dollars
2. Warren has  $y$  dollars.
3. They want to know who has more money.
4. They don't want to reveal their worth to the other.
5. Yao came up with a protocol that will reveal to both who has more money but will not reveal to either how much the other has ASSUMING that neither one can do Discrete Log fast.

# REU Project

There are Cryptosystems that are NOT based on Number Theoretic Problems being hard.

# REU Project

There are Cryptosystems that are NOT based on Number Theoretic Problems being hard.  
Several are based on problems with Lattices being hard.

# REU Project

There are Cryptosystems that are NOT based on Number Theoretic Problems being hard.

Several are based on problems with Lattices being hard.

Hence the name **Lattice-Theoretic Cryptography**.
