FINAL REVIEW-CONTENT

▲□▶▲圖▶▲≧▶▲≧▶ 差 のへで

Alice, Bob, and Eve

- Alice sends a message to Bob in code.
- Eve overhears it.
- We want Eve to not get any information.

There are many aspects to this:

- Information-Theoretic Security.
- Comp-Theoretic Security (Hardness Assumption)
- NY,NY problem.
- Private Key or Public key
- Kerckhoff's principle: Eve knows cryptosystem.

▲ロト ▲ 同 ト ▲ 国 ト → 国 ト → の Q ()

Private Key Ciphers

Single Letter Sub Ciphers

- 1. Shift cipher: f(x) = x + s. $s \in \{0, ..., 25\}$.
- 2. Affine cipher: f(x) = ax + b. $a, b \in \{0, ..., 25\}$. *a* rel prime 26.
- Keyword Shift: From keyword and shift create random-looking perm of {a,...,z}.
- 4. Keyword Mixed: From keyword create random-looking perm of {*a*,...,*z*}.
- 5. Gen Sub Cipher: Take random perm of $\{a, \ldots, z\}$.

All Single Letter Sub Ciphers Crackable

Important: Algorithm Is-English.

- 1. Input(T) a text
- **2**. Find f_T , the freq vector of T
- 3. Find $x = f_T \cdot f_E$ where f_E is freq vector for English
- 4. If $x \ge 0.06$ then output YES. If $x \le 0.04$ then output NO. If 0.04 < x < 0.06 then something is wrong.

How to Use:

- 1. Shift , Affine have small key space: can try all keys and see when Is-English says YES.
- 2. For others use freq analysis.
- 3. If message Credit Cards or ASCII there are patterns; use freq analysis.

Randomized Shift

How to avoid NY,NY Problem:

Randomized shift: Key is a function $f: S \rightarrow S$.

- 1. To send message (m_1, \ldots, m_L) (each m_i is a character)
 - 1.1 Pick random $r_1, \ldots, r_L \in S$. For $1 \le i \le L$ compute $s_i = f(r_i)$.

- **1.2** Send $((r_1; m_1 + s_1), \dots, (r_L; m_L + s_L))$
- 2. To decode message $((r_1; c_1), ..., (r_L; c_L))$
 - 2.1 For $1 \le i \le L \ s_i = f(r_i)$. 2.2 Find $(c_1 - s_1, ..., c_L - s_L)$ Note: Can be cracked.

More Advanced Ciphers

- Vigenère cipher (Can get more out of the phrase using LCM)
- 2. Book Cipher
- 3. Matrix Cipher
- 4. Playfair, Railfence, Autokey
- 5. General 2-letter sub.

All have their PROS and CONS but all are, in the real world, crackable (today).

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ● □ ● ● ● ●

One-time pad

- **1**. Let $M = \{0, 1\}^n$
- **2**. *Gen*: choose a uniform key $k \in \{0, 1\}^n$
- 3. $Enc_k(m) = k \oplus m$
- **4**. $Dec_k(c) = k \oplus c$
- 5. Proof of Correctness:

$$Dec_k(Enc_k(m)) = k \oplus (k \oplus m)$$
$$= (k \oplus k) \oplus m$$
$$= m$$

*ロ * * @ * * ミ * ミ * ・ ミ * の < や

PROS AND CONS Of One-time pad

- 1. If Key is *N* bits long can only send *N* bits.
- **2.** \oplus is FAST!
- 3. The one-time pad is uncrackable. YEAH!
- 4. Generating truly random bits is hard. BOO!
- 5. Pseudo-random can be insecure I did example of cracking linear Congruential generators.

Recall If Alice and Bob do RSA and Eve observes: 1. Eve sees (N, e, m^e). The message is m.

◆□▶ ◆□▶ ◆□▶ ◆□▶ = つくぐ

Recall If Alice and Bob do RSA and Eve observes:

- 1. Eve sees (N, e, m^e) . The message is m.
- 2. Eve knows that there exists primes p, q such that N = pq, but she does not know what p, q are.

Recall If Alice and Bob do RSA and Eve observes:

- 1. Eve sees (N, e, m^e) . The message is m.
- 2. Eve knows that there exists primes p, q such that N = pq, but she does not know what p, q are.
- 3. Eve knows that *e* is relatively prime to (p-1)(q-1).

Recall If Alice and Bob do RSA and Eve observes:

- 1. Eve sees (N, e, m^e) . The message is m.
- 2. Eve knows that there exists primes p, q such that N = pq, but she does not know what p, q are.

3. Eve knows that *e* is relatively prime to (p-1)(q-1). Definition: Let *f* be $f(N, e, m^e) = m$, where N = pq and *e* has an inverse mod (p-1)(q-1).

Hardness assumption (HA): *f* is hard to compute.

Plain RSA Bytes!

The RSA given above is referred to as Plain RSA. Insecure! m is always coded as $m^e \pmod{N}$.

Make secure by padding: $m \in \{0, 1\}^{L_1}, r \in \{0, 1\}^{L_2}$.

To send $m \in \{0, 1\}^{L_1}$, pick rand $r \in \{0, 1\}^{L_2}$, send $(rm)^e$. (NOTE- rm means r CONCAT with m here and elsewhere.) DEC: Alice finds rm and takes rightmost L_1 bits. Caveat: RSA still has issues when used in real world. They have been fixed. Maybe.

- 3. BG PRO- equiv to factoring. No real CON. Might have caught on if history was different.

Factoring Algorithms: Pollard p-1

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ● □ ● ● ● ●

Pollard p-1 algorithm

Parameter B and hence also

$$M = \prod_{q \leq B, q \text{ prime}} q^{\lceil \log_q(B) \rceil}.$$

```
FOUND = FALSE
while NOT FOUND
    a=RAND(1,N-1)
    d=GCD(a^M-1,N)
    if d=1 then increase B
    if d=N then decrease B
    if (d NE 1,N) then FOUND=TRUE
output(d)
```

Pollard p-1 algorithm

Parameter B and hence also

$$M = \prod_{q \leq B, q \text{ prime}} q^{\lceil \log_q(B) \rceil}.$$

```
FOUND = FALSE
while NOT FOUND
    a=RAND(1,N-1)
    d=GCD(a^M-1,N)
    if d=1 then increase B
    if d=N then decrease B
    if (d NE 1,N) then FOUND=TRUE
output(d)
```

```
KEY If p-1 divides M then a^M - 1 \equiv 0 \pmod{N} so GCD(a^M - 1, N) will yield factor.
NOTE Works well if p-1 only has small factors so more likely p-1 divides M.
```

Factoring Algorithms: Pollard rho

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ● □ ● ● ● ●

Concrete Scenario If you have 23 people in a room than the prob that there are two with the same birthday is $\geq \frac{1}{2}$. Note that there are 365 birthdays. View this as putting 23 people into 365 buckets.

Concrete Scenario If you have 23 people in a room than the prob that there are two with the same birthday is $\geq \frac{1}{2}$. Note that there are 365 birthdays. View this as putting 23 people into 365 buckets.

General Scenario If you put $2\sqrt{n}$ balls into *n* buckets the prob that there are 2 balls in the same bucket is $\geq \frac{1}{2}$.

Pollard ρ Algorithm

Define $f_c(x) \leftarrow x * x + c$. Looks random.

 $x \leftarrow RAND(0, N-1), c \leftarrow RAND(0, N-1), y \leftarrow f_c(x)$ while TRUE

Pollard ϕ **Algorithm:** Though Exp

Let *p* be the least prime that div *N*. We do not know *p*. The sequence *x*, $f_c(x)$, $f(f_c(x))$, ... is random-looking.

Pollard ϕ Algorithm: Though Exp

Let p be the least prime that div N. We do not know p. The sequence x, $f_c(x)$, $f(f_c(x))$, ... is random-looking. Put each element of the seq into its \equiv class mod p.

(ロト・日本・モン・モン・モージック)

Let *p* be the least prime that div *N*. We do not know *p*. The sequence *x*, $f_c(x)$, $f(f_c(x))$, ... is random-looking. Put each element of the seq into its \equiv class mod *p*. View the \equiv -classes as buckets at the sequence as balls.

(ロト・日本・モン・モン・モージック)

Let p be the least prime that div N. We do not know p. The sequence x, $f_c(x)$, $f(f_c(x))$, ... is random-looking. Put each element of the seq into its \equiv class mod p. View the \equiv -classes as buckets at the sequence as balls. By Bday Paradox there will 2 elements of the seq in same bucket within the first $2\sqrt{p} \leq 2N^{1/4}$ with high prob.

Let *p* be the least prime that div *N*. We do not know *p*. The sequence *x*, $f_c(x)$, $f(f_c(x))$, ... is random-looking.

Put each element of the seq into its \equiv class mod p.

View the \equiv -classes as buckets at the sequence as balls.

By Bday Paradox there will 2 elements of the seq in same bucket within the first $2\sqrt{p} \le 2N^{1/4}$ with high prob.

By Thm there is an *i* such that the *i*th element in same bucket as 2*i*th element, some $i \le 3\sqrt{N^{1/4}}$, with high prob.

Let *p* be the least prime that div *N*. We do not know *p*. The sequence *x*, $f_c(x)$, $f(f_c(x))$, ... is random-looking. Put each element of the seq into its \equiv class mod *p*.

View the \equiv -classes as buckets at the sequence as balls.

By Bday Paradox there will 2 elements of the seq in same bucket within the first $2\sqrt{p} \le 2N^{1/4}$ with high prob.

By Thm there is an *i* such that the *i*th element in same bucket as 2*i*th element, some $i \leq 3\sqrt{N^{1/4}}$, with high prob.

(ロト・日本・モン・モン・モージック)

Hence $(\exists x, y)[x \equiv y \pmod{p}]$ so $GCD(x - y, N) \neq 1$.

Let *p* be the least prime that div *N*. We do not know *p*. The sequence *x*, $f_c(x)$, $f(f_c(x))$, ... is random-looking.

Put each element of the seq into its \equiv class mod p.

View the \equiv -classes as buckets at the sequence as balls.

By Bday Paradox there will 2 elements of the seq in same bucket within the first $2\sqrt{p} \le 2N^{1/4}$ with high prob.

By Thm there is an *i* such that the *i*th element in same bucket as 2*i*th element, some $i \leq 3\sqrt{N^{1/4}}$, with high prob.

Hence $(\exists x, y)[x \equiv y \pmod{p}]$ so $GCD(x - y, N) \neq 1$.

Caveat Need the sequence to be truly random to prove it works. Don't have that, but it works in practice.

For which $0 \le i \le 10$ is $((34 + i)^2 \mod N) \equiv 0 \pmod{2}$?

For which $0 \le i \le 10$ is $((34 + i)^2 \mod N) \equiv 0 \pmod{2}$?

Need to know what $(34 + i)^2 \pmod{N}$ is. Key We show $1147 < (34 + i)^2 \le 2 \times 1147$ and hence

$$(34+i)^2 \pmod{N} = (34+i)^2 - 1147$$

For which $0 \le i \le 10$ is $((34 + i)^2 \mod N) \equiv 0 \pmod{2}$?

Need to know what $(34 + i)^2 \pmod{N}$ is. Key We show $1147 < (34 + i)^2 \le 2 \times 1147$ and hence

$$(34+i)^2 \pmod{N} = (34+i)^2 - 1147$$

 $(34+i)^2$ is min: i = 0. Its $34^2 = 1156 > 1147$.

For which $0 \le i \le 10$ is $((34 + i)^2 \mod N) \equiv 0 \pmod{2}$?

Need to know what $(34 + i)^2 \pmod{N}$ is. Key We show $1147 < (34 + i)^2 \le 2 \times 1147$ and hence

$$(34+i)^2 \pmod{N} = (34+i)^2 - 1147$$

 $(34 + i)^2$ is min: i = 0. Its $34^2 = 1156 > 1147$. $(34 + i)^2$ is max:i = 10. Its $44^2 = 1936 < 2 \times 1147$.

For which $0 \le i \le 10$ is $((34 + i)^2 \mod N) \equiv 0 \pmod{2}$?

Need to know what $(34 + i)^2 \pmod{N}$ is. Key We show $1147 < (34 + i)^2 \le 2 \times 1147$ and hence

$$(34+i)^2 \pmod{N} = (34+i)^2 - 1147$$

$$(34 + i)^2$$
 is min: $i = 0$. Its $34^2 = 1156 > 1147$.
 $(34 + i)^2$ is max: $i = 10$. Its $44^2 = 1936 < 2 \times 1147$.
 $(34 + i)^2 \mod 1147 = (34 + i)^2 - 1147 \equiv i^2 - 1 \pmod{2}$.
 $i^2 - 1 \equiv 0 \pmod{2}$ if $i \equiv 1 \pmod{2}$.

For which $0 \le i \le 10$ is $((34 + i)^2 \mod N) \equiv 0 \pmod{2}$?

Need to know what $(34 + i)^2 \pmod{N}$ is. Key We show $1147 < (34 + i)^2 \le 2 \times 1147$ and hence

$$(34+i)^2 \pmod{N} = (34+i)^2 - 1147$$

 $(34+i)^2$ is min: i = 0. Its $34^2 = 1156 > 1147$. $(34+i)^2$ is max:i = 10. Its $44^2 = 1936 < 2 \times 1147$. $(34+i)^2 \mod 1147 = (34+i)^2 - 1147 \equiv i^2 - 1 \pmod{2}$. $i^2 - 1 \equiv 0 \pmod{2}$ if $i \equiv 1 \pmod{2}$.

Can do similar for any prime *p*.

Given N let $x = \left\lceil \sqrt{N} \right\rceil$. All \equiv are mod N. B, M are params.

B-factor $(x+0)^2 \pmod{N}$, ..., $(x+M)^2 \pmod{N}$ by Quad S.

Let $I \subseteq \{0, ..., M\}$ so that $(\forall i \in I)$, y_i is *B*-factored. Find $J \subseteq I$ such that $\sum_{i \in J} \vec{v}_i = \vec{0}$. Hence $\prod_{i \in J} y_i$ has all even exponents, so there exists Y

$$\prod_{i \in J} y_i = Y^2$$

$$(\prod_{i \in J} (x+i))^2 \equiv \prod_{i \in J} y_i = Y^2 \pmod{N}$$
Let $X = \prod_{i \in J} (x+i) \pmod{N}$ and $Y = \prod_{i \in J} q_i^{e_i} \pmod{N}$.
$$X^2 - Y^2 \equiv 0 \pmod{N}.$$
 $GCD(X - Y, N), GCD(X + Y, N)$ should yield factors.

Secret Sharing

Zelda has a secret $s \in \{0, 1\}^n$.

Def: Let $1 \le t \le m$. (t, L)-secret sharing is a way for Zelda to give strings to A_1, \ldots, A_L such that:

1. If any *t* get together than they can learn the secret.

If any *t*−1 get together they cannot learn the secret.

Threshold Secret Sharing Caveats

Cannot learn the secret. Two flavors:

- 1. info-theoretic
- 2. computational.

Note: Access Structure is a set of sets of students closed under superset. Can also look at Secret Sharing with other access structures.

◆□ ▶ ◆□ ▶ ◆ □ ▶ ◆ □ ▶ ● □ ● ● ● ●

Methods For Secret Sharing

Assume |s| = n.

- Random String Method.
 PRO: Can be used for ANY access structure.
 CON: For Threshold Zelda may have to give Alice LOTS of strings
- 2. Poly Method. Uses: t points det poly of deg t-1. PRO: Zelda gives Alice a share of exactly n. Simple. CON: Only used for threshold secret sharing CAVEAT: For exactly n need fields. Get n+1 with mod p.

If demand Info-theoretic security then shares have to be $\geq |s|$.

◆□▶ ◆□▶ ◆□▶ ◆□▶ = つくぐ

We did that in class.

So we go to comp theoretic, next slide.

Thm: Assume there exists an α -SES. Assume that for message of length n, it is secure. Then, for all $1 \le t \le L$ there is a (t, L)-scheme for |s| = n where each share is of size $\frac{n}{t} + \alpha n$.

$$g(x) = r_{t-1}x^{t-1} + \cdots + r_1x + k$$

5. Zelda gives A_i , (f(i), g(i)). Length: $\sim \frac{n}{t} + \alpha n$.

Verifiable Secret Sharing VSS

Cannot do it if demand info-theoretic security. That was a HW. So we go to comp theoretic, next slide.

◆□▶ ◆□▶ ◆□▶ ◆□▶ = つくぐ

Verifiable Secret Sharing

- 1. Secret is s, |s| = n. Zelda finds $p \sim n$.
- **2**. Zelda finds a generator g for \mathbb{Z}_p .

3. Zelda picks rand
$$r_{t-1}, ..., r_1$$
,
 $f(x) = r_{t-1}x^{t-1} + \cdots + r_1x + s$.

- **4**. For $1 \le i \le L$ Zelda gives $A_i f(i)$.
- 5. Zelda gives to EVERYONE the values $g^{r_1}, \ldots, g^{r_{t-1}}, g^s, g$.

(We think discrete log is HARD so r_i not revealed.)

Recover: The usual – any group of *t* can blah blah. **Verify:** A_i reveals f(i) = 17. Group computes: 1) g^{17} . 2) $(g^{r_{t-1}})^{i^{t-1}} \times (g^{r_{t-2}})^{i^{t-2}} \times \cdots (g^{r_1})^{i^1} \times (g^s)^{i^0} = g^{f(i)}$ If this is g^{17} then A_i is truthful. If not then A_i is dirty stinking liar.

Alice and Bob and Love

・ロト・ 日本・ エート・ エー・ シックション

The Problem

- Alice has bit a, Bob has bit b, and they want to compute a land b. They have a many decks of cards. At the end of the protocol:
 - **1.1** They both know $a \wedge b$.
 - **1.2** If a = 0 then A does not know b.
 - **1.3** If b = 0 then B does not know a.
 - **1.4** If a = 1 then since A knows a and $a \land b$, A knows b.
 - **1.5** If b = 1 then since B knows b and $a \land b$, B knows a.
