**Side Note** Nobody should be in any admin position for more than 5 years!

 These evals are used in the promotion process (Tenure, Senior lecturer, others). It is our hope that because the Teaching Eval Comm helps people become better teachers, there is NO bad teaching so this is not an obstacle for promotion.

# Example of Why Can't Have Short Shares

Assume there is a (4,5) Secret Sharing Scheme where Zelda shares a secret of length 7.

## Example of Why Can't Have Short Shares

Assume there is a (4,5) Secret Sharing Scheme where Zelda shares a secret of length 7.

(This proof will assume NOTHING about the scheme.)

# Example of Why Can't Have Short Shares

Assume there is a (4,5) Secret Sharing Scheme where Zelda shares a secret of length 7.

(This proof will assume NOTHING about the scheme.)

The players are  $A_1, \ldots, A_5$
Assume there is a (4,5) Secret Sharing Scheme where Zelda shares a secret of length 7.

(This proof will assume NOTHING about the scheme.)

The players are  $A_1, \ldots, A_5$ 

Before the protocol begins there are  $2^7 = 128$  possibilities for the secret.

Assume there is a (4,5) Secret Sharing Scheme where Zelda shares a secret of length 7.

(This proof will assume NOTHING about the scheme.)

The players are  $A_1, \ldots, A_5$ 

Before the protocol begins there are  $2^7 = 128$  possibilities for the secret.

Assume that  $A_5$  gets a share of length 6. We show that the scheme is NOT info-theoretic secure.

If  $A_1, A_2, A_3, A_5$  got together they learn secret, since it's a (4, 5) scheme.

If  $A_1, A_2, A_3, A_5$  got together they learn secret, since it's a (4, 5) scheme.

We show that  $A_1, A_2, A_3$  can learn SOMETHING about the secret.

If  $A_1, A_2, A_3, A_5$  got together they learn secret, since it's a (4, 5) scheme.

We show that  $A_1, A_2, A_3$  can learn SOMETHING about the secret.  $CAND = \emptyset$ . CAND will be set of Candidates for s.

If  $A_1, A_2, A_3, A_5$  got together they learn secret, since it's a (4, 5) scheme.

We show that  $A_1, A_2, A_3$  can learn SOMETHING about the secret.

 $CAND = \emptyset$ . CAND will be set of Candidates for *s*.

For  $x \in \{0,1\}^6$  (go through ALL shares  $A_5$  could have)

If  $A_1, A_2, A_3, A_5$  got together they learn secret, since it's a (4, 5) scheme.

We show that  $A_1, A_2, A_3$  can learn SOMETHING about the secret.  $CAND = \emptyset$ . CAND will be set of Candidates for *s*. For  $x \in \{0, 1\}^6$  (go through ALL shares  $A_5$  could have)  $A_1, A_2, A_3$  pretend  $A_5$  has *x* and deduce candidates secret *s'* 

If  $A_1, A_2, A_3, A_5$  got together they learn secret, since it's a (4, 5) scheme.

We show that  $A_1, A_2, A_3$  can learn SOMETHING about the secret.

 $CAND = \emptyset$ . CAND will be set of Candidates for *s*.

For  $x \in \{0,1\}^6$  (go through ALL shares  $A_5$  could have)

 $A_1, A_2, A_3$  pretend  $A_5$  has x and deduce candidates secret s' CAND := CAND  $\cup \{s'\}$ 

If  $A_1, A_2, A_3, A_5$  got together they learn secret, since it's a (4, 5) scheme.

We show that  $A_1, A_2, A_3$  can learn SOMETHING about the secret.

 $CAND = \emptyset$ . CAND will be set of Candidates for *s*.

For  $x \in \{0,1\}^6$  (go through ALL shares  $A_5$  could have)

 $A_1, A_2, A_3$  pretend  $A_5$  has x and deduce candidates secret s'  $CAND := CAND \cup \{s'\}$ 

Secret is in CAND.  $|CAND| = 2^6 < 2^7$ .

If  $A_1, A_2, A_3, A_5$  got together they learn secret, since it's a (4, 5) scheme.

We show that  $A_1, A_2, A_3$  can learn SOMETHING about the secret.

 $CAND = \emptyset$ . CAND will be set of Candidates for *s*.

For  $x \in \{0,1\}^6$  (go through ALL shares  $A_5$  could have)

 $A_1, A_2, A_3$  pretend  $A_5$  has x and deduce candidates secret s' CAND := CAND  $\cup \{s'\}$ 

Secret is in CAND.  $|CAND| = 2^6 < 2^7$ .

So  $A_1, A_2, A_3$  have **eliminated** many strings from being the secret *s*.

If  $A_1, A_2, A_3, A_5$  got together they learn secret, since it's a (4, 5) scheme.

We show that  $A_1, A_2, A_3$  can learn SOMETHING about the secret.

 $CAND = \emptyset$ . CAND will be set of Candidates for *s*.

For  $x \in \{0,1\}^6$  (go through ALL shares  $A_5$  could have)

 $A_1, A_2, A_3$  pretend  $A_5$  has x and deduce candidates secret s' CAND := CAND  $\cup \{s'\}$ 

Secret is in CAND.  $|CAND| = 2^6 < 2^7$ .

So  $A_1, A_2, A_3$  have **eliminated** many strings from being the secret *s*.

That is INFORMATION!!!!

If  $A_1, A_2, A_3, A_5$  got together they learn secret, since it's a (4, 5) scheme.

We show that  $A_1, A_2, A_3$  can learn SOMETHING about the secret.

 $CAND = \emptyset$ . CAND will be set of Candidates for *s*.

For  $x \in \{0,1\}^6$  (go through ALL shares  $A_5$  could have)

 $A_1, A_2, A_3$  pretend  $A_5$  has x and deduce candidates secret s' CAND := CAND  $\cup \{s'\}$ 

Secret is in CAND.  $|CAND| = 2^6 < 2^7$ .

So  $A_1, A_2, A_3$  have **eliminated** many strings from being the secret *s*.

That is INFORMATION!!!!

On the HW you will do more examples and perhaps generalize to show can NEVER have shorter shares.

#### Are Shorter Shares Ever Possible?

If we **demand** info-security then **everyone** gets a share  $\ge n$ . What if we only **demand** comp-security? **VOTE**

2. If t - 1 of them get together they cannot find *s*.

That is not quite right. Why?

1. If  $\geq t$  of them get together they can find *s*.

2. If  $\leq t - 1$  of them get together they cannot find *s*.

We want to generalize and look at other subsets.

#### Example

1. If an even number of players get together can find s.

2. If an odd number of players get together can't find s.

Try to find a scheme for this secret sharing problem.

You've Been Punked!

 $A_1, A_2$  CAN find s but  $A_1, A_2, A_3$  CANNOT. Thats Stupid!

・ロト・個ト・ヨト・ヨト ヨー りへぐ

1. If  $\geq t$  of them get together they can find out secret.

▲□▶ ▲□▶ ▲ 臣▶ ▲ 臣▶ ― 臣 … のへぐ

- 1. If  $\geq t$  of them get together they can find out secret.
- 2. If  $\leq t 1$  of them get together they cannot find out secret.

Let's rephrase that so we can generalize:

1. If  $\geq t$  of them get together they can find out secret.

2. If  $\leq t - 1$  of them get together they cannot find out secret. Let's rephrase that so we can generalize:  $\mathcal{X}$  is the set of all subsets of  $\{A_1, \ldots, A_m\}$  with  $\geq t$  players.

1. If  $\geq t$  of them get together they can find out secret.

2. If  $\leq t - 1$  of them get together they cannot find out secret.

Let's rephrase that so we can generalize:

 $\mathcal X$  is the set of all subsets of  $\{A_1,\ldots,A_m\}$  with  $\geq t$  players.

1. If  $Y \in \mathcal{X}$  then the players in Y can find s.

1. If  $\geq t$  of them get together they can find out secret.

2. If  $\leq t - 1$  of them get together they cannot find out secret.

Let's rephrase that so we can generalize:

 $\mathcal{X}$  is the set of all subsets of  $\{A_1, \ldots, A_m\}$  with  $\geq t$  players.

- 1. If  $Y \in \mathcal{X}$  then the players in Y can find s.
- 2. If  $Y \notin \mathcal{X}$  then the players in Y cannot find s.

This question makes sense. What is it about  $\mathcal{X}$  that makes it make sense?

1. If  $\geq t$  of them get together they can find out secret.

2. If  $\leq t - 1$  of them get together they cannot find out secret.

Let's rephrase that so we can generalize:

 $\mathcal{X}$  is the set of all subsets of  $\{A_1, \ldots, A_m\}$  with  $\geq t$  players.

- 1. If  $Y \in \mathcal{X}$  then the players in Y can find s.
- 2. If  $Y \notin \mathcal{X}$  then the players in Y cannot find s.

This question makes sense. What is it about  $\mathcal{X}$  that makes it make sense?

 $\mathcal{X}$  is closed under superset:

If  $Y \in \mathcal{X}$  and  $Y \subseteq Z$  then  $Z \in \mathcal{X}$ .

**Def** An Access Structure is a set of subset of  $\{A_1, \ldots, A_m\}$  closed under superset.

Want that a group can find the secret if either it has 1. at least 2 of  $A_1, A_2, A_3$ , OR

Want that a group can find the secret if either it has

- 1. at least 2 of  $A_1, A_2, A_3$ , OR
- 2. at least 4 of  $B_1, B_2, B_3, B_4, B_5, B_6, B_7$ .

How can Zelda do this?

Want that a group can find the secret if either it has

- 1. at least 2 of  $A_1, A_2, A_3$ , OR
- 2. at least 4 of  $B_1, B_2, B_3, B_4, B_5, B_6, B_7$ .

How can Zelda do this?

1. Zelda does (2,3) secret sharing with  $A_1, A_2, A_3$ .

Want that a group can find the secret if either it has

- 1. at least 2 of  $A_1, A_2, A_3$ , OR
- 2. at least 4 of  $B_1, B_2, B_3, B_4, B_5, B_6, B_7$ .

How can Zelda do this?

- 1. Zelda does (2,3) secret sharing with  $A_1, A_2, A_3$ .
- 2. Zelda does (4,7) secret sharing with  $B_1, B_2, B_3, B_4, B_5, B_6, B_7$ .

Want that a group can find the secret if either it has

- 1. at least 2 of  $A_1, A_2, A_3$ , OR
- 2. at least 4 of  $B_1, B_2, B_3, B_4, B_5, B_6, B_7$ .

How can Zelda do this?

- 1. Zelda does (2,3) secret sharing with  $A_1, A_2, A_3$ .
- 2. Zelda does (4,7) secret sharing with  $B_1, B_2, B_3, B_4, B_5, B_6, B_7$ . To generalize this we need a better notation.

Let  $TH_A(t, m)$  be the Boolean Formula that represents at least t out of m of the  $A_i$ 's.

・ロト・日本・ヨト・ヨト・日・ つへぐ

Let  $TH_A(t, m)$  be the Boolean Formula that represents at least t out of m of the  $A_i$ 's. **Example**  $TH_A(2, 4)$  is At least 2 of  $A_1, A_2, A_3, A_4$ .

Let  $TH_A(t, m)$  be the Boolean Formula that represents at least t out of m of the  $A_i$ 's. **Example**  $TH_A(2, 4)$  is At least 2 of  $A_1, A_2, A_3, A_4$ . **Example**  $TH_B(3, 6)$  is At least 3 of  $B_1, \ldots, B_6$ .

Let  $TH_A(t, m)$  be the Boolean Formula that represents at least t out of m of the  $A_i$ 's. **Example**  $TH_A(2, 4)$  is At least 2 of  $A_1, A_2, A_3, A_4$ . **Example**  $TH_B(3, 6)$  is At least 3 of  $B_1, \ldots, B_6$ . **Note**  $TH_A(t, m)$  has ideal secret sharing.

Let  $TH_A(t, m)$  be the Boolean Formula that represents at least t out of m of the  $A_i$ 's. **Example**  $TH_A(2, 4)$  is At least 2 of  $A_1, A_2, A_3, A_4$ . **Example**  $TH_B(3, 6)$  is At least 3 of  $B_1, \ldots, B_6$ . Note  $TH_A(t, m)$  has ideal secret sharing. Notation  $TH_A(t_1, m_1) \vee TH_B(t_2, m_2)$  means that:

Let  $TH_A(t, m)$  be the Boolean Formula that represents at least t out of m of the  $A_i$ 's. **Example**  $TH_A(2, 4)$  is At least 2 of  $A_1, A_2, A_3, A_4$ . **Example**  $TH_B(3, 6)$  is At least 3 of  $B_1, \ldots, B_6$ . Note  $TH_A(t, m)$  has ideal secret sharing. Notation  $TH_A(t_1, m_1) \vee TH_B(t_2, m_2)$  means that:

1.  $\geq t_1 A_1, \ldots, A_{m_1}$  can learn the secret.

Let  $TH_A(t, m)$  be the Boolean Formula that represents at least t out of m of the  $A_i$ 's. **Example**  $TH_A(2, 4)$  is At least 2 of  $A_1, A_2, A_3, A_4$ . **Example**  $TH_B(3, 6)$  is At least 3 of  $B_1, \ldots, B_6$ . - 4. :
- 5. Zelda does  $(t_{25}, m_{25})$  secret sharing of  $r_{25}$  with  $Y_i$ 's.
- 6. Zelda does  $(t_{26}, m_{26})$  secret sharing of  $r_1 \oplus \cdots \oplus r_{25} \oplus s$  with  $Z_i$ 's.
- 7. If  $\geq t_1$  of  $A_i$ 's get together they can find  $r_1$ . If  $\geq t_2$  of  $B_i$ 's get together they can find  $r_2$ .  $\cdots$  If  $\geq t_{25}$  of  $Y_i$ 's get together they can find  $r_{25}$ . If  $\geq t_{26}$  of  $Z_i$ 's get together they can find  $r_1 \oplus \cdots \oplus r_{25} \oplus s$ . So if they call get together they can find

$$r_1 \oplus \cdots \oplus r_{25} \oplus (r_1 \oplus \cdots \oplus r_{25} \oplus s) = s$$

### **General Theorem**

**Definition** A **monotone formula** is a Boolean formula with no NOT signs.

If you put together what we did with TH and use induction you can prove the following:

**Theorem** Let  $X_1, \ldots, X_N$  each be a threshold  $TH_A(t, m)$  but all using DIFFERENT players.

Let  $F(X_1, ..., X_N)$  be a monotone Boolean formula where each  $X_i$  appears only once. Then Zelda can do ideal secret sharing where only sets that satisfy  $F(X_1, ..., X_N)$  can learn the secret.
## **General Theorem**

**Definition** A **monotone formula** is a Boolean formula with no NOT signs.

If you put together what we did with TH and use induction you can prove the following:

**Theorem** Let  $X_1, \ldots, X_N$  each be a threshold  $TH_A(t, m)$  but all using DIFFERENT players.

Let  $F(X_1,...,X_N)$  be a monotone Boolean formula where each  $X_i$  appears only once. Then Zelda can do ideal secret sharing where only sets that satisfy  $F(X_1,...,X_N)$  can learn the secret.

Routine proof left to the reader. Might be on a HW or the Final.

- (A<sub>1</sub> ∧ A<sub>2</sub> ∧ A<sub>3</sub>) ∨ (A<sub>1</sub> ∧ A<sub>4</sub>) ∨ (A<sub>2</sub> ∧ A<sub>4</sub>) ∨ (A<sub>3</sub> ∨ A<sub>4</sub>) (Captain and Crew) A<sub>1</sub>, A<sub>2</sub>, A<sub>3</sub> is the crew, and A<sub>4</sub> is the captain. Entire crew, or captain and 1 crew, can get s.
- 3.  $(A_1 \land A_2 \land A_3) \lor (A_1 \land A_4) \lor (A_2 \land A_4)$  (Captain and Rival)  $A_1, A_2, A_3$  is the crew,  $A_3$  is a rival,  $A_4$  is the captain. Entire crew, or captain and 1 crew who is NOT rival, can get *s*.

ション ふぼう メリン メリン しょうくしゃ

- 1.  $(A_1 \wedge A_2) \vee (A_2 \wedge A_3) \vee (A_3 \wedge A_4)$
- (A<sub>1</sub> ∧ A<sub>2</sub> ∧ A<sub>3</sub>) ∨ (A<sub>1</sub> ∧ A<sub>4</sub>) ∨ (A<sub>2</sub> ∧ A<sub>4</sub>) ∨ (A<sub>3</sub> ∨ A<sub>4</sub>) (Captain and Crew) A<sub>1</sub>, A<sub>2</sub>, A<sub>3</sub> is the crew, and A<sub>4</sub> is the captain. Entire crew, or captain and 1 crew, can get s.
- 3.  $(A_1 \land A_2 \land A_3) \lor (A_1 \land A_4) \lor (A_2 \land A_4)$  (Captain and Rival)  $A_1, A_2, A_3$  is the crew,  $A_3$  is a rival,  $A_4$  is the captain. Entire crew, or captain and 1 crew who is NOT rival, can get *s*.

4. Any access structure that **contains** any of the above.

In all of the above, all get a share of size 1.5n and this is optimal.

Zelda wants to share secret such that:

- 1. If  $A_1, A_2, A_3$  get together they can get secret.
- 2. If  $A_1, A_4$  get together they can get secret.
- 3. If  $A_2$ ,  $A_4$  get together they can get secret.

By the last slide we know that CANNOT do ideal secret sharing.

▲ロ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ▲ □ ▶ ● ○ ○ ○

Zelda wants to share secret such that:

- 1. If  $A_1, A_2, A_3$  get together they can get secret.
- 2. If  $A_1, A_4$  get together they can get secret.
- 3. If  $A_2$ ,  $A_4$  get together they can get secret.

By the last slide we know that CANNOT do ideal secret sharing. Can Zelda do secret sharing? VOTE Yes or NO.

ション ふぼう メリン メリン しょうくしゃ

Zelda wants to share secret such that:

- 1. If  $A_1, A_2, A_3$  get together they can get secret.
- 2. If  $A_1, A_4$  get together they can get secret.
- 3. If  $A_2$ ,  $A_4$  get together they can get secret.

By the last slide we know that CANNOT do ideal secret sharing. Can Zelda do secret sharing? VOTE Yes or NO. YES- but do not use polynomials, use the random string method.

Known

#### Known

1. Using Random String Method every Access Structure with m people has a secret sharing scheme with  $2^m n$  sized shares.

#### Known

- 1. Using Random String Method every Access Structure with m people has a secret sharing scheme with  $2^m n$  sized shares.
- 2. Threshold and many other Access Structures can do secret sharing with *n*-sized shares.

#### Known

- 1. Using Random String Method every Access Structure with m people has a secret sharing scheme with  $2^m n$  sized shares.
- 2. Threshold and many other Access Structures can do secret sharing with *n*-sized shares.
- 3. Some Access Structures require MORE THAN *n*-sized shares.

**Open** Determine for every access structure the functions f(n) and g(n) such that
