

BILL, RECORD LECTURE!!!!

BILL RECORD LECTURE!!!

Math Needed for Both Diffie-Hellman and RSA

Notation

Let p be a prime.

1. \mathbb{Z}_p is the numbers $\{0, \dots, p - 1\}$ with mod add and mult.
2. \mathbb{Z}_p^* is the numbers $\{1, \dots, p - 1\}$ with mod mult.

Convention By **prime** we will always mean a large prime, so in particular, NOT 2. Hence we can assume $\frac{p-1}{2}$ is in \mathbb{N} .

Repeated Squaring Algorithm

All math is mod p .

Repeated Squaring Algorithm

All math is mod p .

1. Input (a, n, p) .

Repeated Squaring Algorithm

All math is mod p .

1. Input (a, n, p) .
2. Convert n to base 2: $n = \sum_{i=0}^L n_i 2^i$. (L is $\lfloor \lg(n) \rfloor$)

Repeated Squaring Algorithm

All math is mod p .

1. Input (a, n, p) .
2. Convert n to base 2: $n = \sum_{i=0}^L n_i 2^i$. (L is $\lfloor \lg(n) \rfloor$)
3. $x_0 = a$.

Repeated Squaring Algorithm

All math is mod p .

1. Input (a, n, p) .
2. Convert n to base 2: $n = \sum_{i=0}^L n_i 2^i$. (L is $\lfloor \lg(n) \rfloor$)
3. $x_0 = a$.
4. For $i = 1$ to L , $x_i = x_{i-1}^2$

Repeated Squaring Algorithm

All math is mod p .

1. Input (a, n, p) .
2. Convert n to base 2: $n = \sum_{i=0}^L n_i 2^i$. (L is $\lfloor \lg(n) \rfloor$)
3. $x_0 = a$.
4. For $i = 1$ to L , $x_i = x_{i-1}^2$
5. (Now have $a^{n_0 2^0}, \dots, a^{n_L 2^L}$) Answer is $a^{n_0 2^0} \times \dots \times a^{n_L 2^L}$

Repeated Squaring Algorithm

All math is mod p .

1. Input (a, n, p) .
2. Convert n to base 2: $n = \sum_{i=0}^L n_i 2^i$. (L is $\lfloor \lg(n) \rfloor$)
3. $x_0 = a$.
4. For $i = 1$ to L , $x_i = x_{i-1}^2$
5. (Now have $a^{n_0 2^0}, \dots, a^{n_L 2^L}$) Answer is $a^{n_0 2^0} \times \dots \times a^{n_L 2^L}$

Number of operations:

Repeated Squaring Algorithm

All math is mod p .

1. Input (a, n, p) .
2. Convert n to base 2: $n = \sum_{i=0}^L n_i 2^i$. (L is $\lfloor \lg(n) \rfloor$)
3. $x_0 = a$.
4. For $i = 1$ to L , $x_i = x_{i-1}^2$
5. (Now have $a^{n_0 2^0}, \dots, a^{n_L 2^L}$) Answer is $a^{n_0 2^0} \times \dots \times a^{n_L 2^L}$

Number of operations:

Number of **MULTS** in step 4: $\leq \lfloor \lg(n) \rfloor \leq \lg(n)$

Repeated Squaring Algorithm

All math is mod p .

1. Input (a, n, p) .
2. Convert n to base 2: $n = \sum_{i=0}^L n_i 2^i$. (L is $\lfloor \lg(n) \rfloor$)
3. $x_0 = a$.
4. For $i = 1$ to L , $x_i = x_{i-1}^2$
5. (Now have $a^{n_0 2^0}, \dots, a^{n_L 2^L}$) Answer is $a^{n_0 2^0} \times \dots \times a^{n_L 2^L}$

Number of operations:

Number of **MULTS** in step 4: $\leq \lfloor \lg(n) \rfloor \leq \lg(n)$

Number of **MULTS** in step 5: $\leq L = \lfloor \lg(n) \rfloor \leq \lg(n)$

Repeated Squaring Algorithm

All math is mod p .

1. Input (a, n, p) .
2. Convert n to base 2: $n = \sum_{i=0}^L n_i 2^i$. (L is $\lfloor \lg(n) \rfloor$)
3. $x_0 = a$.
4. For $i = 1$ to L , $x_i = x_{i-1}^2$
5. (Now have $a^{n_0 2^0}, \dots, a^{n_L 2^L}$) Answer is $a^{n_0 2^0} \times \dots \times a^{n_L 2^L}$

Number of operations:

Number of **MULTS** in step 4: $\leq \lfloor \lg(n) \rfloor \leq \lg(n)$

Number of **MULTS** in step 5: $\leq L = \lfloor \lg(n) \rfloor \leq \lg(n)$

Total number of **MULTS** $\leq 2 \lg(n)$.

Repeated Squaring Algorithm

All math is mod p .

1. Input (a, n, p) .
2. Convert n to base 2: $n = \sum_{i=0}^L n_i 2^i$. (L is $\lfloor \lg(n) \rfloor$)
3. $x_0 = a$.
4. For $i = 1$ to L , $x_i = x_{i-1}^2$
5. (Now have $a^{n_0 2^0}, \dots, a^{n_L 2^L}$) Answer is $a^{n_0 2^0} \times \dots \times a^{n_L 2^L}$

Number of operations:

Number of **MULTS** in step 4: $\leq \lfloor \lg(n) \rfloor \leq \lg(n)$

Number of **MULTS** in step 5: $\leq L = \lfloor \lg(n) \rfloor \leq \lg(n)$

Total number of **MULTS** $\leq 2 \lg(n)$.

More refined: $\lg(n) + (\text{number of 1's in binary rep of } n) - 1$

Repeated Squaring Algorithm

All math is mod p .

1. Input (a, n, p) .
2. Convert n to base 2: $n = \sum_{i=0}^L n_i 2^i$. (L is $\lfloor \lg(n) \rfloor$)
3. $x_0 = a$.
4. For $i = 1$ to L , $x_i = x_{i-1}^2$
5. (Now have $a^{n_0 2^0}, \dots, a^{n_L 2^L}$) Answer is $a^{n_0 2^0} \times \dots \times a^{n_L 2^L}$

Number of operations:

Number of **MULTS** in step 4: $\leq \lfloor \lg(n) \rfloor \leq \lg(n)$

Number of **MULTS** in step 5: $\leq L = \lfloor \lg(n) \rfloor \leq \lg(n)$

Total number of **MULTS** $\leq 2 \lg(n)$.

More refined: $\lg(n) + (\text{number of 1's in binary rep of } n) - 1$

Example on next page

Example of Exponentiation: $17^{265} \pmod{101}$

$$265 = 2^8 + 2^3 + 2^0 = (100001001)_2$$

Example of Exponentiation: $17^{265} \pmod{101}$

$$265 = 2^8 + 2^3 + 2^0 = (100001001)_2$$

$$17^{2^0} \equiv 17 \text{ (0 steps)}$$

Example of Exponentiation: $17^{265} \pmod{101}$

$$265 = 2^8 + 2^3 + 2^0 = (100001001)_2$$

$$17^{2^0} \equiv 17 \text{ (0 steps)}$$

$$17^{2^1} \equiv 17^2 \equiv 87 \text{ (1 step)}$$

Example of Exponentiation: $17^{265} \pmod{101}$

$$265 = 2^8 + 2^3 + 2^0 = (100001001)_2$$

$$17^{2^0} \equiv 17 \text{ (0 steps)}$$

$$17^{2^1} \equiv 17^2 \equiv 87 \text{ (1 step)}$$

$$17^{2^2} \equiv 87^2 \equiv 95 \text{ (1 step)}$$

Example of Exponentiation: $17^{265} \pmod{101}$

$$265 = 2^8 + 2^3 + 2^0 = (100001001)_2$$

$$17^{2^0} \equiv 17 \pmod{101} \text{ (0 steps)}$$

$$17^{2^1} \equiv 17^2 \equiv 87 \pmod{101} \text{ (1 step)}$$

$$17^{2^2} \equiv 87^2 \equiv 95 \pmod{101} \text{ (1 step)}$$

$$17^{2^3} \equiv 95^2 \equiv 36 \pmod{101} \text{ (1 step)}$$

Example of Exponentiation: $17^{265} \pmod{101}$

$$265 = 2^8 + 2^3 + 2^0 = (100001001)_2$$

$$17^{2^0} \equiv 17 \text{ (0 steps)}$$

$$17^{2^1} \equiv 17^2 \equiv 87 \text{ (1 step)}$$

$$17^{2^2} \equiv 87^2 \equiv 95 \text{ (1 step)}$$

$$17^{2^3} \equiv 95^2 \equiv 36 \text{ (1 step)}$$

$$17^{2^4} \equiv 36^2 \equiv 84 \text{ (1 step)}$$

Example of Exponentiation: $17^{265} \pmod{101}$

$$265 = 2^8 + 2^3 + 2^0 = (100001001)_2$$

$$17^{2^0} \equiv 17 \text{ (0 steps)}$$

$$17^{2^1} \equiv 17^2 \equiv 87 \text{ (1 step)}$$

$$17^{2^2} \equiv 87^2 \equiv 95 \text{ (1 step)}$$

$$17^{2^3} \equiv 95^2 \equiv 36 \text{ (1 step)}$$

$$17^{2^4} \equiv 36^2 \equiv 84 \text{ (1 step)}$$

$$17^{2^5} \equiv 84^2 \equiv 87 \text{ (1 step)}$$

Example of Exponentiation: $17^{265} \pmod{101}$

$$265 = 2^8 + 2^3 + 2^0 = (100001001)_2$$

$$17^{2^0} \equiv 17 \text{ (0 steps)}$$

$$17^{2^1} \equiv 17^2 \equiv 87 \text{ (1 step)}$$

$$17^{2^2} \equiv 87^2 \equiv 95 \text{ (1 step)}$$

$$17^{2^3} \equiv 95^2 \equiv 36 \text{ (1 step)}$$

$$17^{2^4} \equiv 36^2 \equiv 84 \text{ (1 step)}$$

$$17^{2^5} \equiv 84^2 \equiv 87 \text{ (1 step)}$$

$$17^{2^6} \equiv 87^2 \equiv 95 \text{ (1 step)}$$

Example of Exponentiation: $17^{265} \pmod{101}$

$$265 = 2^8 + 2^3 + 2^0 = (100001001)_2$$

$$17^{2^0} \equiv 17 \text{ (0 steps)}$$

$$17^{2^1} \equiv 17^2 \equiv 87 \text{ (1 step)}$$

$$17^{2^2} \equiv 87^2 \equiv 95 \text{ (1 step)}$$

$$17^{2^3} \equiv 95^2 \equiv 36 \text{ (1 step)}$$

$$17^{2^4} \equiv 36^2 \equiv 84 \text{ (1 step)}$$

$$17^{2^5} \equiv 84^2 \equiv 87 \text{ (1 step)}$$

$$17^{2^6} \equiv 87^2 \equiv 95 \text{ (1 step)}$$

$$17^{2^7} \equiv 95^2 \equiv 36 \text{ (1 step)}$$

Example of Exponentiation: $17^{265} \pmod{101}$

$$265 = 2^8 + 2^3 + 2^0 = (100001001)_2$$

$$17^{2^0} \equiv 17 \text{ (0 steps)}$$

$$17^{2^1} \equiv 17^2 \equiv 87 \text{ (1 step)}$$

$$17^{2^2} \equiv 87^2 \equiv 95 \text{ (1 step)}$$

$$17^{2^3} \equiv 95^2 \equiv 36 \text{ (1 step)}$$

$$17^{2^4} \equiv 36^2 \equiv 84 \text{ (1 step)}$$

$$17^{2^5} \equiv 84^2 \equiv 87 \text{ (1 step)}$$

$$17^{2^6} \equiv 87^2 \equiv 95 \text{ (1 step)}$$

$$17^{2^7} \equiv 95^2 \equiv 36 \text{ (1 step)}$$

$$17^{2^8} \equiv 36^2 \equiv 84 \text{ (1 step)}$$

Example of Exponentiation: $17^{265} \pmod{101}$

$$265 = 2^8 + 2^3 + 2^0 = (100001001)_2$$

$$17^{2^0} \equiv 17 \text{ (0 steps)}$$

$$17^{2^1} \equiv 17^2 \equiv 87 \text{ (1 step)}$$

$$17^{2^2} \equiv 87^2 \equiv 95 \text{ (1 step)}$$

$$17^{2^3} \equiv 95^2 \equiv 36 \text{ (1 step)}$$

$$17^{2^4} \equiv 36^2 \equiv 84 \text{ (1 step)}$$

$$17^{2^5} \equiv 84^2 \equiv 87 \text{ (1 step)}$$

$$17^{2^6} \equiv 87^2 \equiv 95 \text{ (1 step)}$$

$$17^{2^7} \equiv 95^2 \equiv 36 \text{ (1 step)}$$

$$17^{2^8} \equiv 36^2 \equiv 84 \text{ (1 step)}$$

This took $8 \sim \lg(265)$ multiplications so far.

Example of Exponentiation: $17^{265} \pmod{101}$

$$265 = 2^8 + 2^3 + 2^0 = (100001001)_2$$

$$17^{2^0} \equiv 17 \text{ (0 steps)}$$

$$17^{2^1} \equiv 17^2 \equiv 87 \text{ (1 step)}$$

$$17^{2^2} \equiv 87^2 \equiv 95 \text{ (1 step)}$$

$$17^{2^3} \equiv 95^2 \equiv 36 \text{ (1 step)}$$

$$17^{2^4} \equiv 36^2 \equiv 84 \text{ (1 step)}$$

$$17^{2^5} \equiv 84^2 \equiv 87 \text{ (1 step)}$$

$$17^{2^6} \equiv 87^2 \equiv 95 \text{ (1 step)}$$

$$17^{2^7} \equiv 95^2 \equiv 36 \text{ (1 step)}$$

$$17^{2^8} \equiv 36^2 \equiv 84 \text{ (1 step)}$$

This took $8 \sim \lg(265)$ multiplications so far.

The next step takes only two multiplications:

$$17^{265} \equiv 17^{2^8} \times 17^{2^3} \times 17^{2^0} \equiv 84 \times 36 \times 17 \equiv 100$$

Example of Exponentiation: $17^{265} \pmod{101}$

$$265 = 2^8 + 2^3 + 2^0 = (100001001)_2$$

$$17^{2^0} \equiv 17 \text{ (0 steps)}$$

$$17^{2^1} \equiv 17^2 \equiv 87 \text{ (1 step)}$$

$$17^{2^2} \equiv 87^2 \equiv 95 \text{ (1 step)}$$

$$17^{2^3} \equiv 95^2 \equiv 36 \text{ (1 step)}$$

$$17^{2^4} \equiv 36^2 \equiv 84 \text{ (1 step)}$$

$$17^{2^5} \equiv 84^2 \equiv 87 \text{ (1 step)}$$

$$17^{2^6} \equiv 87^2 \equiv 95 \text{ (1 step)}$$

$$17^{2^7} \equiv 95^2 \equiv 36 \text{ (1 step)}$$

$$17^{2^8} \equiv 36^2 \equiv 84 \text{ (1 step)}$$

This took $8 \sim \lg(265)$ multiplications so far.

The next step takes only two multiplications:

$$17^{265} \equiv 17^{2^8} \times 17^{2^3} \times 17^{2^0} \equiv 84 \times 36 \times 17 \equiv 100$$

Point: Step 2 took $< \lg(265)$ steps since base-2 rep had few 1's.

An Important Point That Some Students Missed

An Important Point That Some Students Missed

Bill Kunal, many students on piazza seem to say their programs are taking too long. Whats up with that?

An Important Point That Some Students Missed

Bill Kunal, many students on piazza seem to say their programs are taking too long. Whats up with that?

Kunal In repeated squaring you are supposed to do the MOD p at EVERY STEP. Half of the students who emailed were doing the exponentiation and THEN doing the MOD p , so they had really large intermediary numbers which slowed things down.

Good Candidate for a hard problem for Eve.

Discrete Log-General

Definition Let p be a prime and g be a generator mod p .

The **Discrete Log Problem**:

Given $a \in \{1, \dots, p\}$, find x such that $g^x \equiv a \pmod{p}$. We call this $DL_{p,g}(a)$.

Discrete Log-General

Definition Let p be a prime and g be a generator mod p .

The **Discrete Log Problem**:

Given $a \in \{1, \dots, p\}$, find x such that $g^x \equiv a \pmod{p}$. We call this $DL_{p,g}(a)$.

1. If g is small then $DL(g^a)$ might be easy: $DL_{1009,7}(49) = 2$ since $7^2 \equiv 49 \pmod{1009}$.

Discrete Log-General

Definition Let p be a prime and g be a generator mod p .

The **Discrete Log Problem**:

Given $a \in \{1, \dots, p\}$, find x such that $g^x \equiv a \pmod{p}$. We call this $DL_{p,g}(a)$.

1. If g is small then $DL(g^a)$ might be easy: $DL_{1009,7}(49) = 2$ since $7^2 \equiv 49 \pmod{1009}$.
2. If g is small then $DL(p - g^a)$ might be easy:
 $DL_{1009,7}(1009 - 49) = 506$ since $7^{504}7^2 \equiv -7^2 \equiv 1009 - 49 \pmod{1009}$.

Discrete Log-General

- ▶ Eve has to do **Discrete Log** to crack it.

Do we have this?

No. But we'll come close.

Convention

For the rest of the slides on **Diffie-Hellman Key Exchange** there will always be a prime p that we are considering.

ALL math done from that point on is mod p .

ALL numbers are in $\{1, \dots, p - 1\}$.

Finding Generators

Finding Gens; How Many Gens Are There?

Problem Given p , find g such that

- ▶ g generates \mathbb{Z}_p^* .
- ▶ $g \in \{\frac{p}{3}, \dots, \frac{2p}{3}\}$. (We ignore floors and ceilings for notational convenience.)

Finding Gens; How Many Gens Are There?

Problem Given p , find g such that

- ▶ g generates \mathbb{Z}_p^* .
- ▶ $g \in \{\frac{p}{3}, \dots, \frac{2p}{3}\}$. (We ignore floors and ceilings for notational convenience.)

We could test $\frac{p}{3}$, then $\frac{p}{3} + 1$, etc. Will we hit a generator soon?

Finding Gens; How Many Gens Are There?

Problem Given p , find g such that

- ▶ g generates \mathbb{Z}_p^* .
- ▶ $g \in \{\frac{p}{3}, \dots, \frac{2p}{3}\}$. (We ignore floors and ceilings for notational convenience.)

We could test $\frac{p}{3}$, then $\frac{p}{3} + 1$, etc. Will we hit a generator soon?

How many elts of $\{1, \dots, p - 1\}$ are gens?

Finding Gens; How Many Gens Are There?

Problem Given p , find g such that

- ▶ g generates \mathbb{Z}_p^* .
- ▶ $g \in \{\frac{p}{3}, \dots, \frac{2p}{3}\}$. (We ignore floors and ceilings for notational convenience.)

We could test $\frac{p}{3}$, then $\frac{p}{3} + 1$, etc. Will we hit a generator soon?

How many elts of $\{1, \dots, p-1\}$ are gens? $\Theta(\frac{p}{\log \log p})$

Finding Gens; How Many Gens Are There?

Problem Given p , find g such that

- ▶ g generates \mathbb{Z}_p^* .
- ▶ $g \in \{\frac{p}{3}, \dots, \frac{2p}{3}\}$. (We ignore floors and ceilings for notational convenience.)

We could test $\frac{p}{3}$, then $\frac{p}{3} + 1$, etc. Will we hit a generator soon?

How many elts of $\{1, \dots, p-1\}$ are gens? $\Theta(\frac{p}{\log \log p})$

Hence if you just look for a gen you will find one soon.

Finding Gens: Useful Theorem

Theorem: If g is **not** a generator then there exists x that

Finding Gens: Useful Theorem

Theorem: If g is **not** a generator then there exists x that

1. x divides $p - 1$, $x \neq 1$, $x \neq -1$.

Finding Gens: Useful Theorem

Theorem: If g is **not** a generator then there exists x that

1. x divides $p - 1$, $x \neq 1$, $x \neq -1$.
2. $g^x \equiv 1$.

So want to use a prime p such that $p - 1$ is easy to factor.

Finding Gens: Final Attempt

Given prime p , find a gen for \mathbb{Z}_p^*

Finding Gens: Final Attempt

Given prime p , find a gen for \mathbb{Z}_p^*

1. Input p a prime such that $p - 1 = 2q$ where q is prime. (We later explore how we can find such a prime.)

Finding Gens: Final Attempt

Given prime p , find a gen for \mathbb{Z}_p^*

1. Input p a prime such that $p - 1 = 2q$ where q is prime. (We later explore how we can find such a prime.)
2. Factor $p - 1$. Let F be the set of its factors except $p - 1$. That's EASY: $F = \{2, q\}$.

Finding Gens: Final Attempt

Given prime p , find a gen for \mathbb{Z}_p^*

1. Input p a prime such that $p - 1 = 2q$ where q is prime. (We later explore how we can find such a prime.)
2. Factor $p - 1$. Let F be the set of its factors except $p - 1$. That's EASY: $F = \{2, q\}$.
3. For $g = \frac{p}{3}$ to $\frac{2p}{3}$:
Compute g^x for all $x \in F$. If any = 1 then g NOT generator. If none are 1 then output g and stop.

Finding Gens: Final Attempt

Given prime p , find a gen for \mathbb{Z}_p^*

1. Input p a prime such that $p - 1 = 2q$ where q is prime. (We later explore how we can find such a prime.)
2. Factor $p - 1$. Let F be the set of its factors except $p - 1$. That's EASY: $F = \{2, q\}$.
3. For $g = \frac{p}{3}$ to $\frac{2p}{3}$:
Compute g^x for all $x \in F$. If any = 1 then g NOT generator. If none are 1 then output g and stop.

Is this a good algorithm?

PRO Every iteration does $O(\log p)$ operations.

Finding Gens: Final Attempt

Given prime p , find a gen for \mathbb{Z}_p^*

1. Input p a prime such that $p - 1 = 2q$ where q is prime. (We later explore how we can find such a prime.)
2. Factor $p - 1$. Let F be the set of its factors except $p - 1$. That's EASY: $F = \{2, q\}$.
3. For $g = \frac{p}{3}$ to $\frac{2p}{3}$:
Compute g^x for all $x \in F$. If any = 1 then g NOT generator. If none are 1 then output g and stop.

Is this a good algorithm?

PRO Every iteration does $O(\log p)$ operations.

CON: Need both p and $\frac{p-1}{2}$ are primes.

Finding Gens: Final Attempt
