

Announcements

- Project #1 grades were returned on Monday
 - Requests for re-grades due by Tuesday
- Midterm #1
 - Re-grade requests due by Monday
- Project #2
 - Due 10 AM Monday

Page State (hardware view)

- Page frame number (location in memory or on disk)
- *Valid Bit*
 - indicates if a page is present in memory or stored on disk
- *A modify or dirty bit*
 - set by hardware on write to a page
 - indicates whether the contents of a page have been modified since the page was last loaded into main memory
 - if a page has not been modified, the page does not have to be written to disk before the page frame can be reused
- *Reference bit*
 - set by the hardware on read/write
 - cleared by OS
 - can be used to approximate LRU page replacement
- *Protection attributes*
 - read, write, execute

What happens when we fault and there are no more physical pages?

- Need to remove a page from main memory
 - if it is “dirty” we must store it to disk first.
 - dirty pages have been modified since they were last stored on disk.
- How to we pick a page?
 - Need to choose an appropriate algorithm
 - should it be global?
 - should it be local (one owned by the faulting process)

Page Replacement Algorithms

- FIFO

- Replace the page that was brought in longest ago
- However
 - old pages may be great pages (frequently used)
 - number of page faults may increase when one increases number of page frames (discouraging!)
 - called belady's anomaly
 - 1,2,3,4,1,2,5,1,2,3,4,5 (consider 3 vs. 4 frames)

- Optimal

- Replace the page that will be used furthest in the future
- Good algorithm(!) but requires knowledge of the future
- With good compiler assistance, knowledge of the future is sometimes possible

Page Replacement Algorithms

- LRU

- Replace the page that was actually used longest ago
- Implementation of LRU can be a bit expensive
 - e.g. maintain a stack of nodes representing pages and put page on top of stack when the page is accessed
 - maintain a time stamp associated with each page

- Approximate LRU algorithms

- maintain reference bit(s) which are set whenever a page is used
- at the end of a given time period, reference bits are cleared

FIFO Example (3 frames)

- Reference string: 1,2,3,4,1,2,5,1,2,3,4,5
 - access 1 - (1) fault
 - access 2 - (1,2) fault
 - access 3- (1,2,3) fault
 - access 4 - (2,3,4) fault, replacement
 - access 1 - (3,4,1) fault, replacement
 - access 2 - (4,1,2) fault, replacement
 - access 5 - (1,2,5) fault, replacement
 - access 1- (1,2,5)
 - access 2 - (1,2,5)
 - access 3 - (2,5,3) fault, replacement
 - access 4 - (5,3,4) fault, replacement
 - access 5 - (5,3,4)
- 9 page faults

LRU Example (3 frames)

- Reference string: 1,2,3,4,1,2,5,1,2,3,4,5
 - access 1 - (1) fault
 - access 2 - (1,2) fault
 - access 3- (1,2,3) fault
 - access 4 - (2,3,4) fault, replacement
 - access 1 - (3,4,1) fault, replacement
 - access 2 - (4,1,2) fault, replacement
 - access 5 - (1,2,5) fault, replacement
 - access 1- (2,5,1)
 - access 2 - (5,1,2)
 - access 3 - (1,2,3) fault, replacement
 - access 4 - (2,3,4) fault, replacement
 - access 5 - (3,4,5) fault, replacement
- 10 page faults

LRU Example (4 frames)

- Reference string: 1,2,3,4,1,2,5,1,2,3,4,5
 - access 1 - (1) fault
 - access 2 - (1,2) fault
 - access 3- (1,2,3) fault
 - access 4 - (1,2,3,4) fault, replacement
 - access 1 - (2,3,4,1)
 - access 2 - (3,4,1,2)
 - access 5 - (4,1,2,5) fault, replacement
 - access 1- (4,2,5,1)
 - access 2 - (4,5,1,2)
 - access 3 - (5,1,2,3) fault, replacement
 - access 4 - (1,2,3,4) fault, replacement
 - access 5 - (2,3,4,5) fault, replacement
- 8 faults

FIFO Example (4 frames)

- Reference string: 1,2,3,4,1,2,5,1,2,3,4,5
 - access 1 - (1) fault
 - access 2 - (1,2) fault
 - access 3 - (1,2,3) fault
 - access 4 - (1,2,3,4) fault, replacement
 - access 1 - (1,2,3,4)
 - access 2 - (1,2,3,4)
 - access 5 - (2,3,4,5) fault, replacement
 - access 1 - (3,4,5,1) fault, replacement
 - access 2 - (4,5,1,2) fault, replacement
 - access 3 - (5,1,2,3) fault, replacement
 - access 4 - (1,2,3,4) fault, replacement
 - access 5 - (2,3,4,5) fault, replacement
- 10 Page faults

Thrashing

- Virtual memory is not “free”
 - can allocate so much virtual memory that the system spends all its time getting pages
 - the situation is called thrashing
 - need to select one or more processes to swap out
- Swapping
 - write all of the memory of a process out to disk
 - don't run the process for a period of time
 - part of medium term scheduling
- How do we know when we are thrashing?
 - check CPU utilization?
 - check paging rate?
 - Answer: need to look at both
 - low CPU utilization plus high paging rate --> thrashing
