1. (10) Suppose we have a matrix $A$ of dimension $n \times n$ of rank $n - 1$. Give two numerically stable ways to find a vector $z$ so that $Az = 0$. 
2. (10) Recall the Gram-Schmidt algorithm:

Set $r_{11} = \|a_1\|$.

Set $q_1 = a_1/r_{11}$.

for $k = 1, \ldots n - 1$,

Set $q_{k+1} = a_{k+1}$.

for $i = 1, \ldots, k$,

\[ r_{i,k+1} = q_{k+1}^T q_i \]
\[ q_{k+1} = q_{k+1} - r_{i,k+1} q_i \]

end for

\[ r_{k+1,k+1} = \|q_{k+1}\| \]
\[ q_{k+1} = q_{k+1} / r_{k+1,k+1} \]

end for

Show that $q_i^T q_k = 0$ for $i < k$.
