

# VeriWeb

## Automatically Testing Dynamic Web Sites

Michael Benedikt   Juliana Freire   Patrice Godefroid

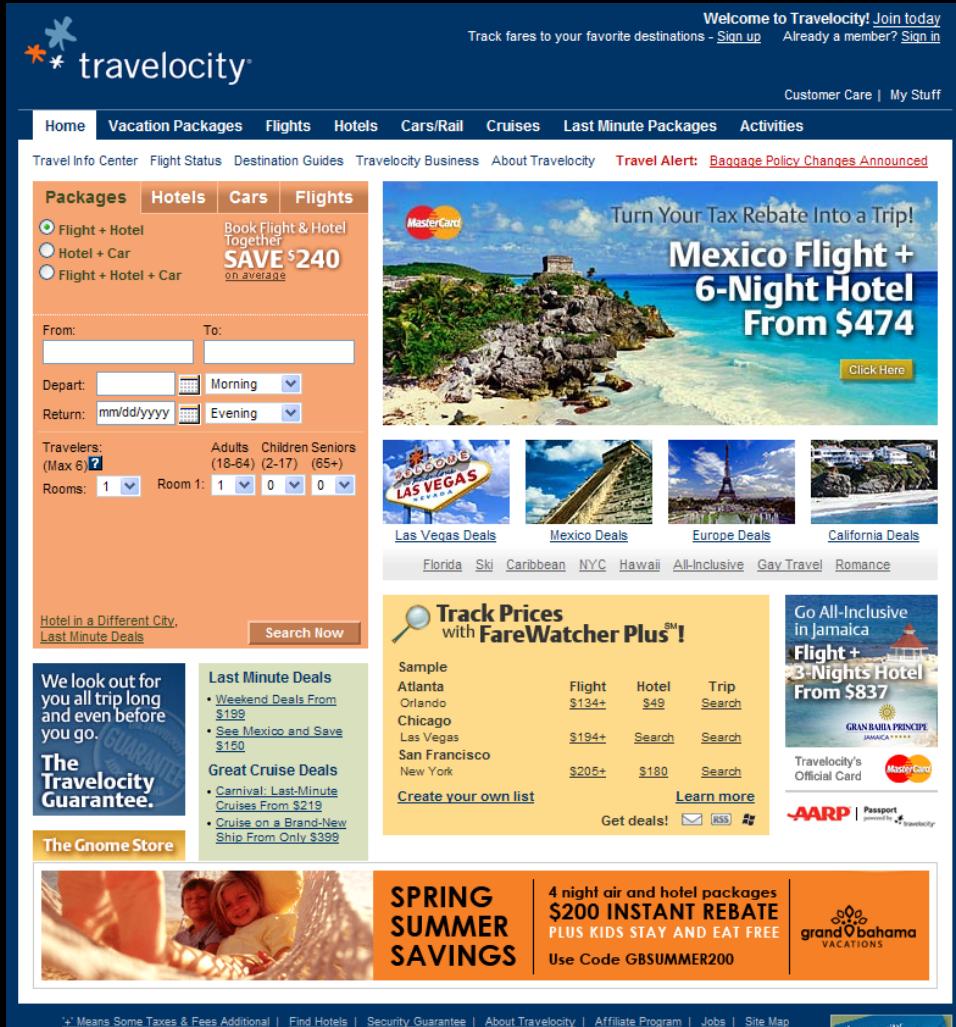

Presented by

Krist Wongsuphasawat

# Outline

1. Motivation
2. Previous Works
3. What is VeriWeb?
4. VeriWeb Architecture
5. Exploring Algorithm
6. Automatically Filling Form
7. Conclusion

# 1.1 Motivation

Web pages became  
very complex.

- 154 Links
  - 7 Forms
  - >161 Actions?

# 1.1 Motivation

Web navigation became very complex.

Flight 1 Round-Trip Ticket

Mon, Apr 21, 2008 Washington Dulles International Airport (IAD) to Orlando International Airport (MCO)

Flight 2 Round-Trip Ticket

Mon, Apr 21, 2008 Orlando International Airport (MCO) to Washington Dulles International Airport (IAD)

Flight Protection

Protect Yourself and Your Trip

Select an option before you continue.

Yes! I want to purchase Flight Protection for only \$15.95 per person.  
(Available to U.S. residents only.)

No, thanks. I do not want to purchase Flight Protection for this trip.

The Travel Protection Plan includes:

- Refundable airfares
- Up to \$1,000 per passenger if you cancel or change your flight due to a covered reason.
- Up to \$100 per passenger if you cancel or change your flight due to a covered reason.
- Meal Request (not all flights offer free meals)
- No Preference

# 1.1 Motivation

**Many things can go wrong.**

- Interaction between HTML pages
- Application on pages
  - Java Applet, JavaScript, etc.
- Application on server side
  - Dynamic pages, Database Interfaces, CGI
- Wide variety of server and browsers
- Rapidly Changing Technology

## 1.2 Challenges

- Web sites are complex applications.
- Web sites are updated often.
  - Hard to keep test suite updated
- Web sites are highly intertwined with the environment
  - e.g. browser, OS, etc.
  - Impossible to test stand-alone
- Users are inexperienced
  - Unexpected behavior

## 2. Previous Works

- **Crawlers**

- check links and pages for common errors

- e.g. LinkCheck, SiteInspector, Weblint, Webtrends
  - broken links, unreachable pages, HTML errors, etc.
  - Go through **links**

- **Capture-replay tools**

- explore **particular** scenario in a dynamic web site

- e.g. MacroBot, Silktest, etester, etc.
  - Record interactions that can be played back unattended.
  - Must **manually** create interactions.

## 3.1 What is VeriWeb?

Exercises multiple scenarios in a web application that are automatically discovered

VeriWeb = Crawlers + Capture-replay tools + more

exploits scenarios that include dynamic portions of sites  
Unlike a capture-replay tool, no recording is needed

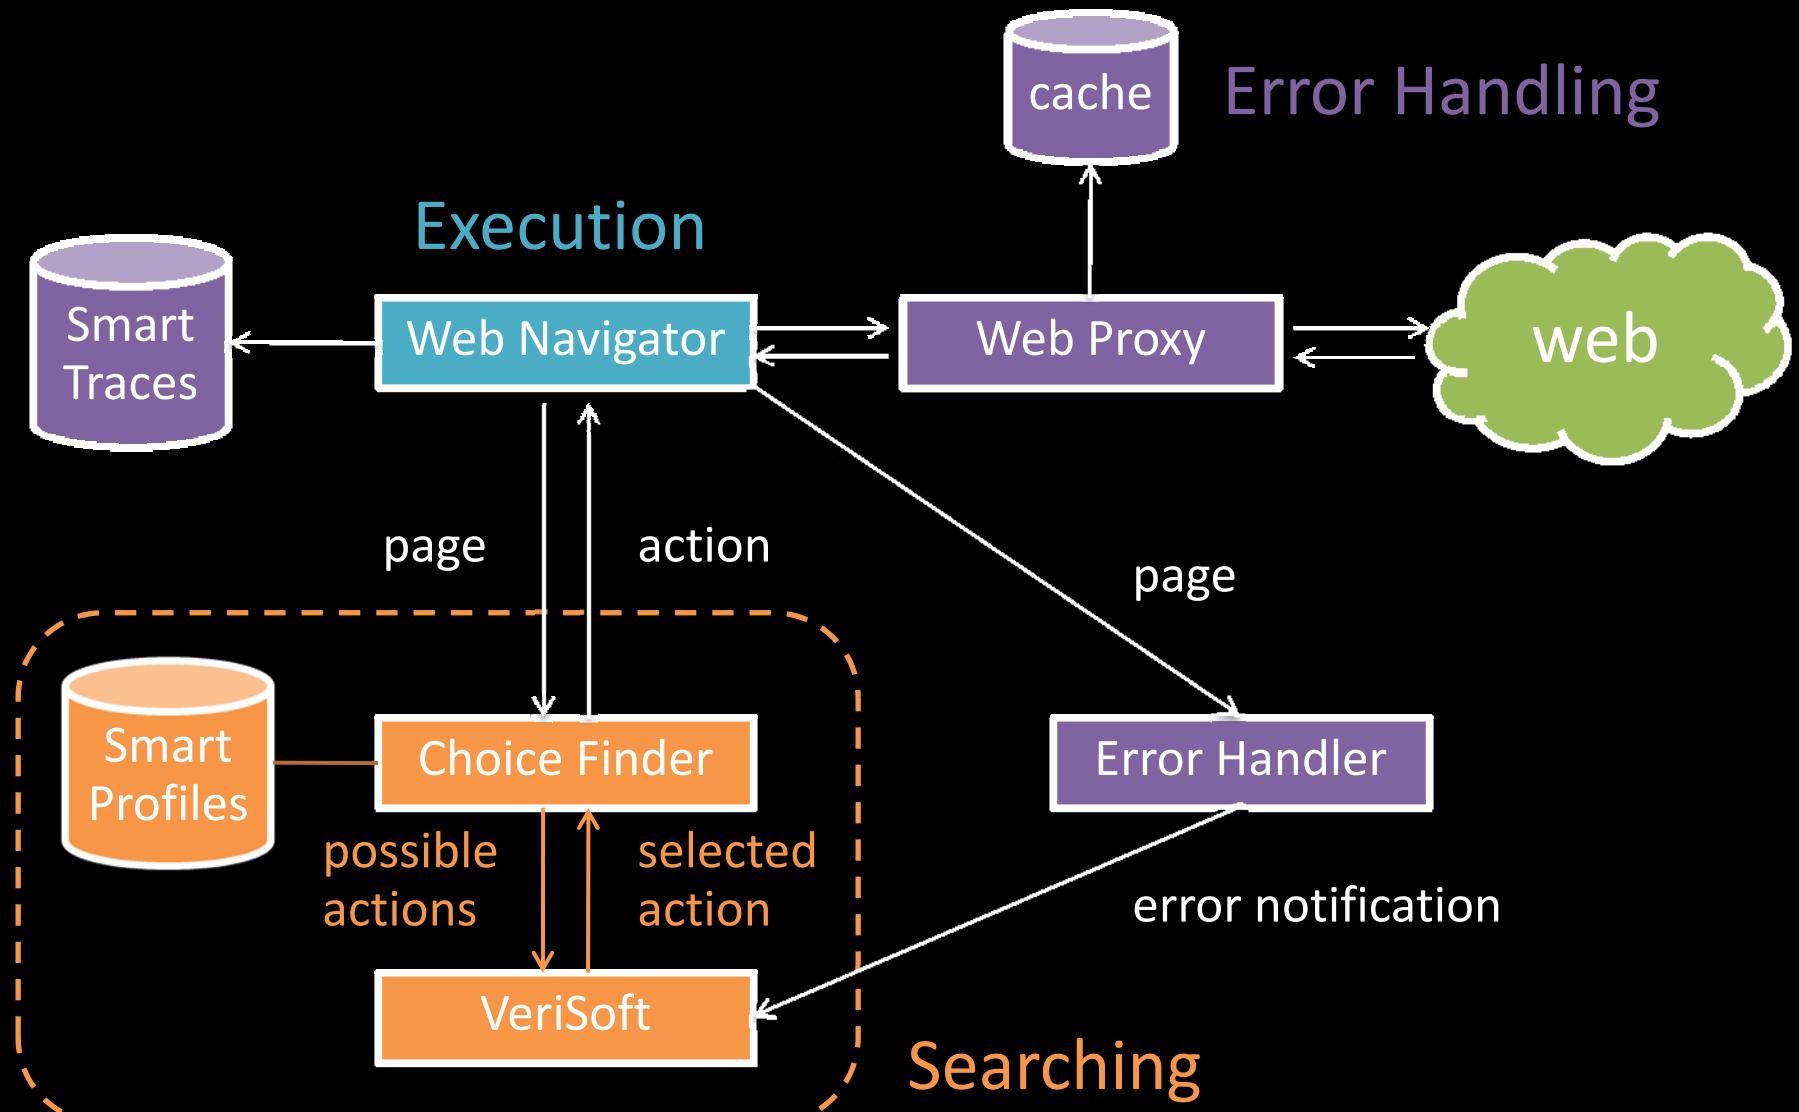

exhaustively searches the site for errors

Unlike a crawler, it can go through forms

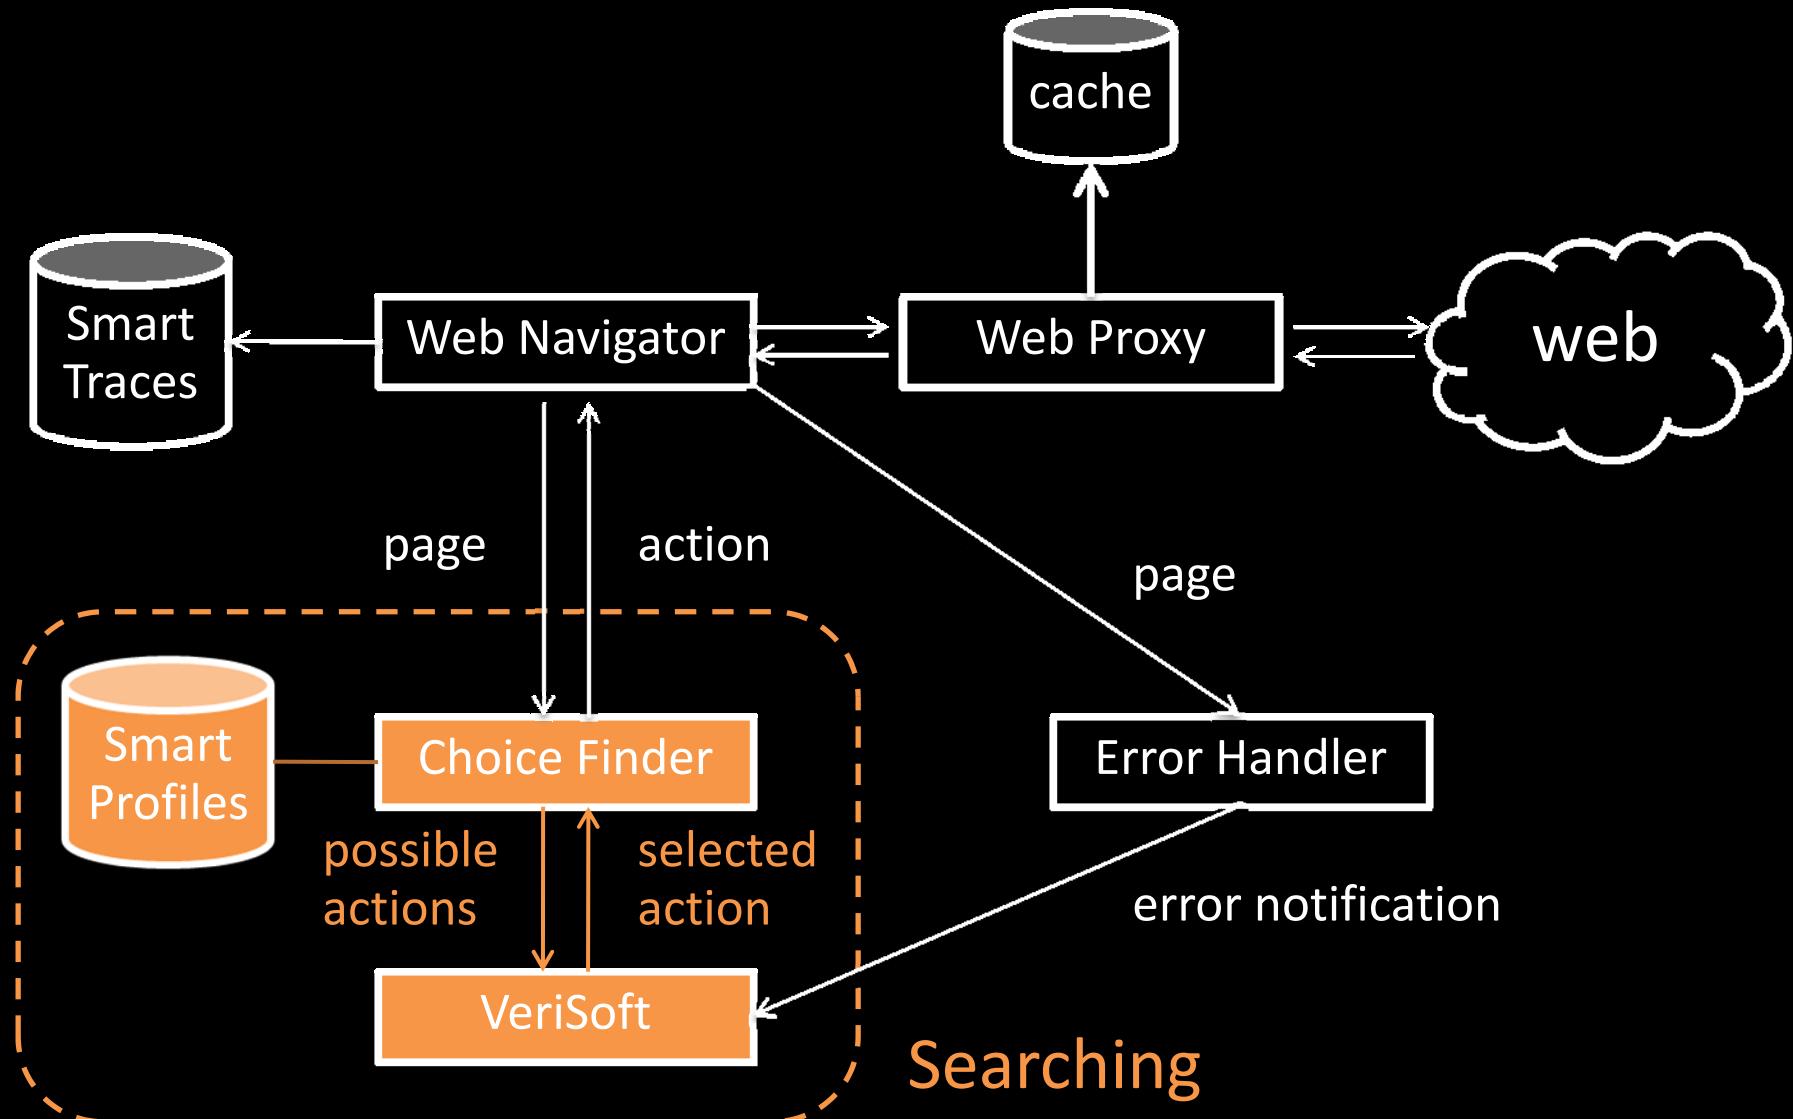

## 3.2 VeriWeb Features

- Functional testing
  - both static and dynamic elements of Web site
- Regression testing
- Standard correctness checks
  - e.g., broken links, malformed URLs
- Realistic testing
  - Tests are run through a Web browser and closely mimic users' actions

# 4. VeriWeb Architecture

## 4.1 Searching

## 4.1 Searching

Exercise all possible execution paths a user might follow in a web site

- 2 tasks
  1. Action Discovery – ChoiceFinder
  2. Exploration Control - VeriSoft

## 4.1.1 ChoiceFinder

Find the set of possible actions from that page

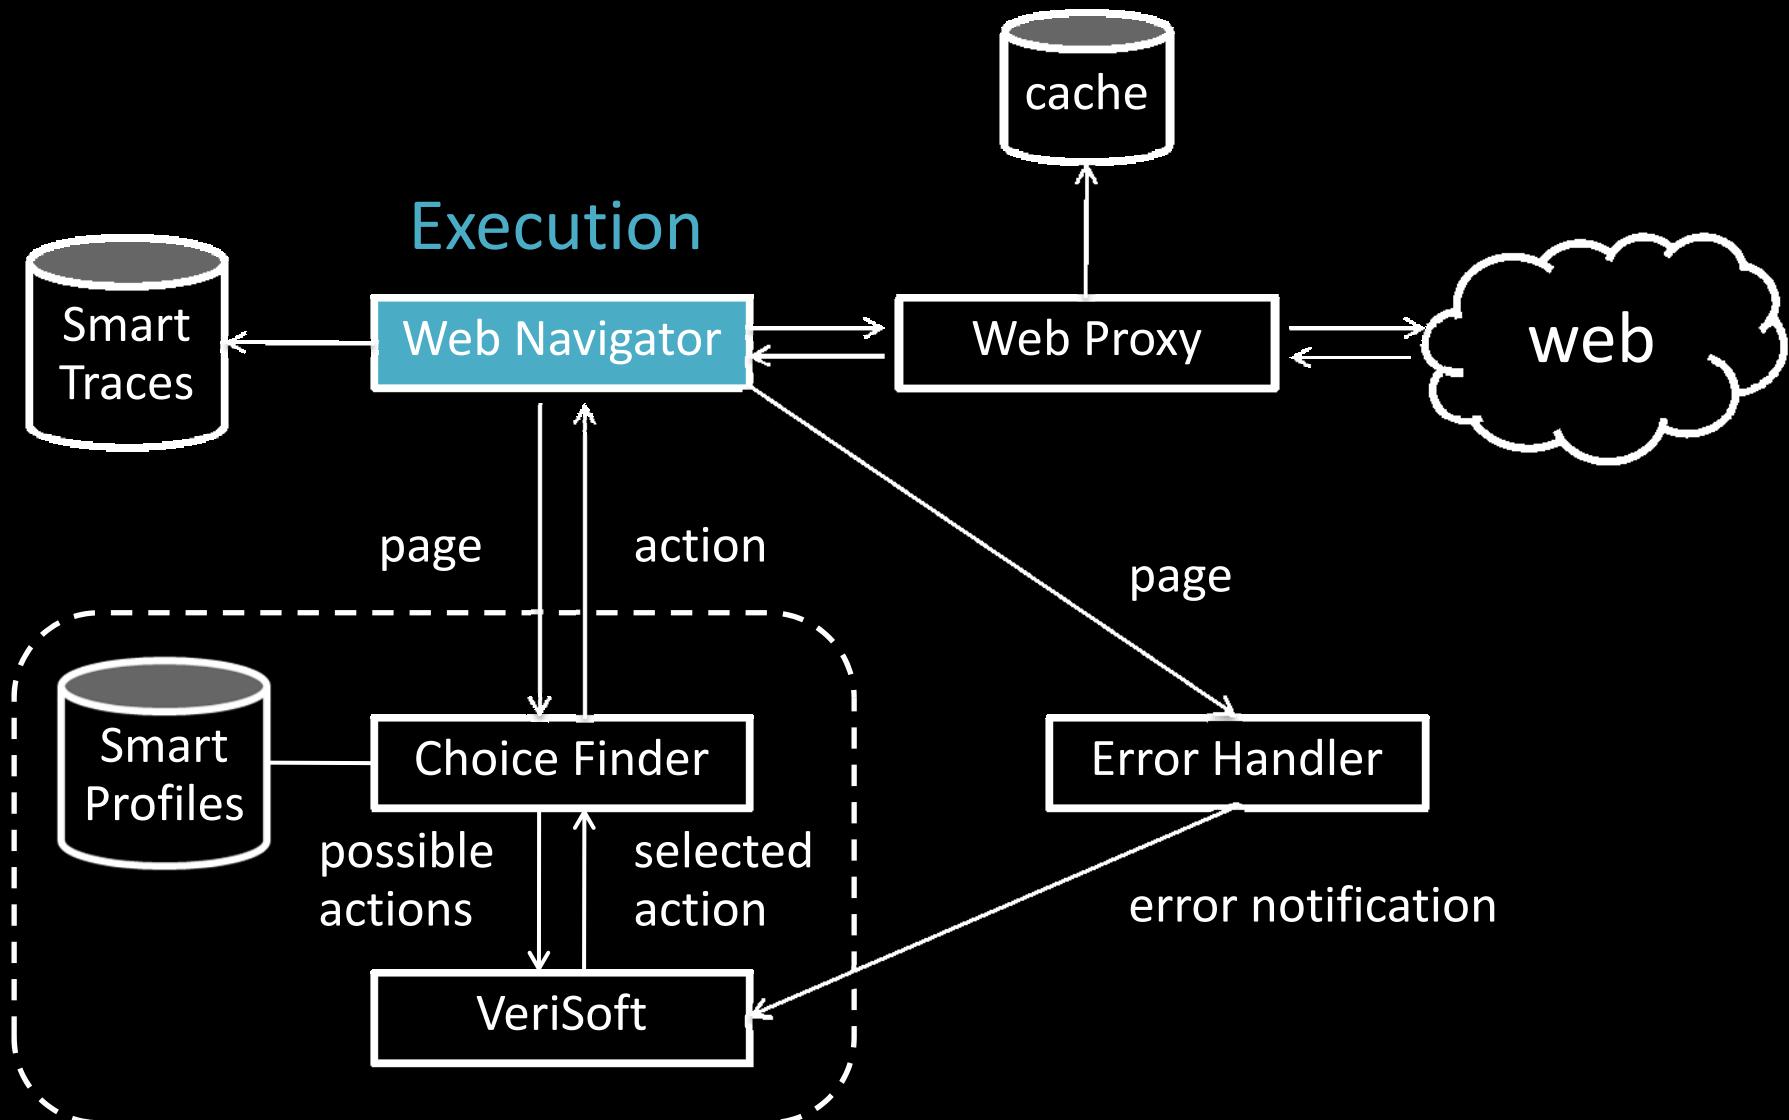

- Analyze HTML to find links, forms, buttons, etc.
- 2 challenges
  1. How to fill in forms?
  2. How to prune the search spaces?

## 4.1.2 Verisoft

### Explore the state spaces

- Guarantee complete coverage of the state space up to some depth
- When error is detected, a scenario leading to error state is saved.
- Saved scenarios can be replayed.

## 4.2 Execution

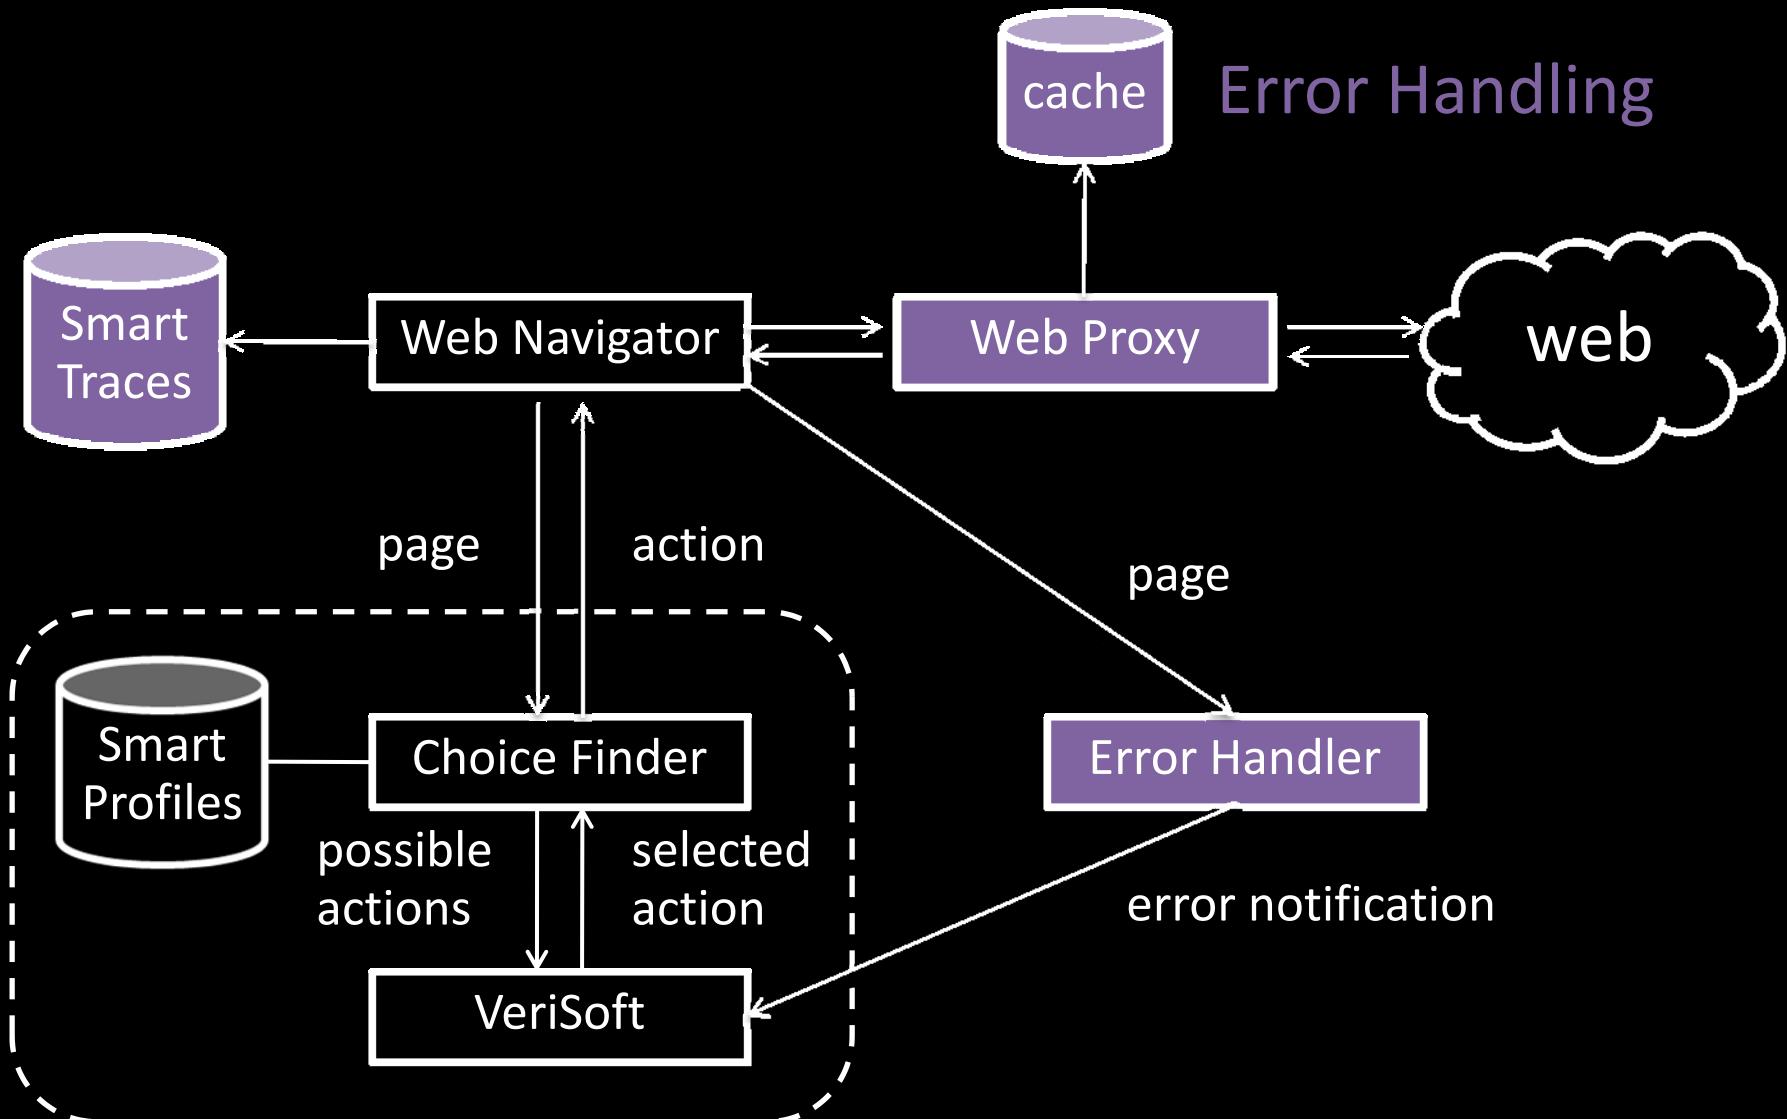

## 4.2.1 Web Navigator

Mimics what a user would do while interacting with Browser

- Execute actions for selected choice
  - Link: follow link
  - Form: fill and submit form
  - etc.

## 4.3 Error Handling

## 4.3.1 Type of Errors

### 2 Types of errors

#### 1. Navigation Errors

- e.g. Failure in retrieving a page
- Detected by [Web Navigator](#)

#### 2. Page Errors

- Your constraints
- Detected by [Error Handler](#)
- Various checking modules can be invoked from [ErrorHandler](#)

## 4.3.2 Error Logging

### 3 Different levels

#### 1. VeriSoft

- error traces
- scenario (i.e. state-space path from the starting page)

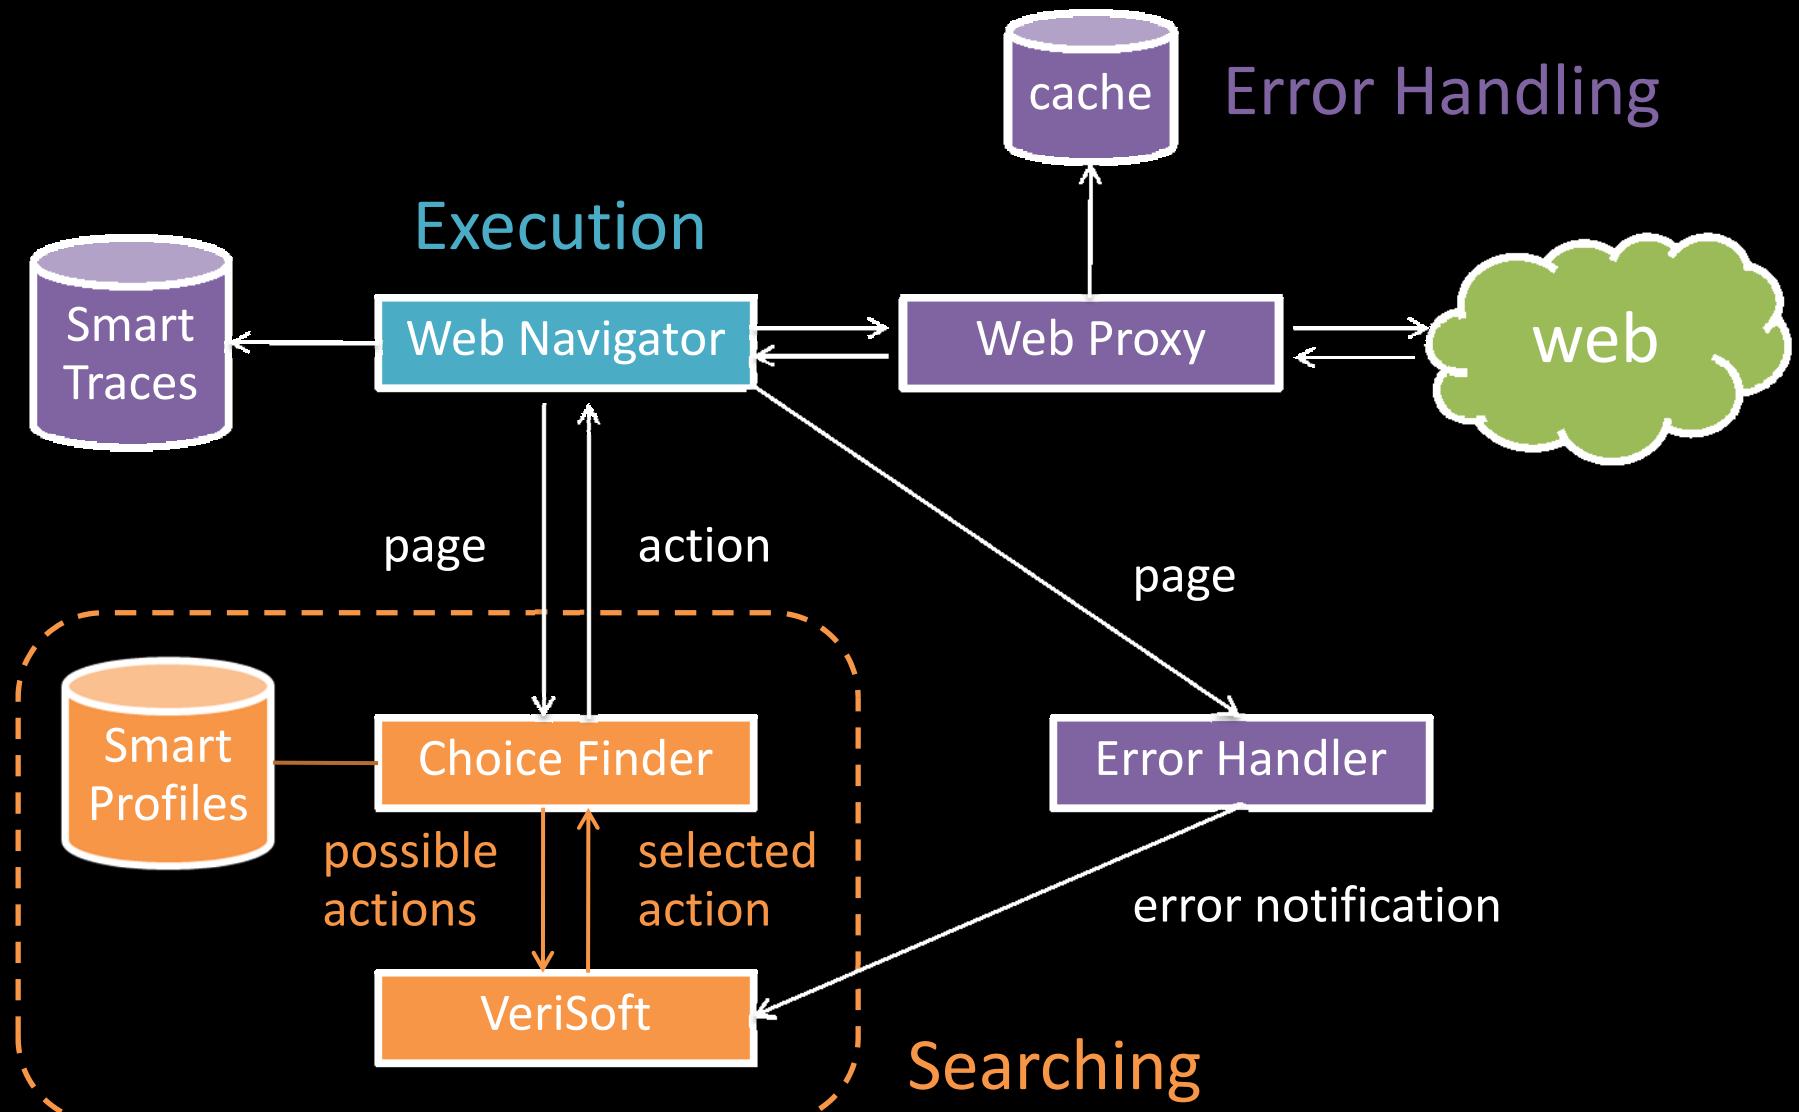

#### 2. Web Navigator

- smart traces (smart bookmarks)
- richer representation of scenario
- can be replayed by WebVCR
- robust, can be replayed even web page structural changes

#### 3. Web Proxy

- cached pages
- all visited pages or just pages in scenarios that lead to errors
- offline error detection

# 4. VeriWeb Architecture

# 5.1 Exploration Algorithm

`ExploreSite(startingURL,constraints)`  \*One run for one Path

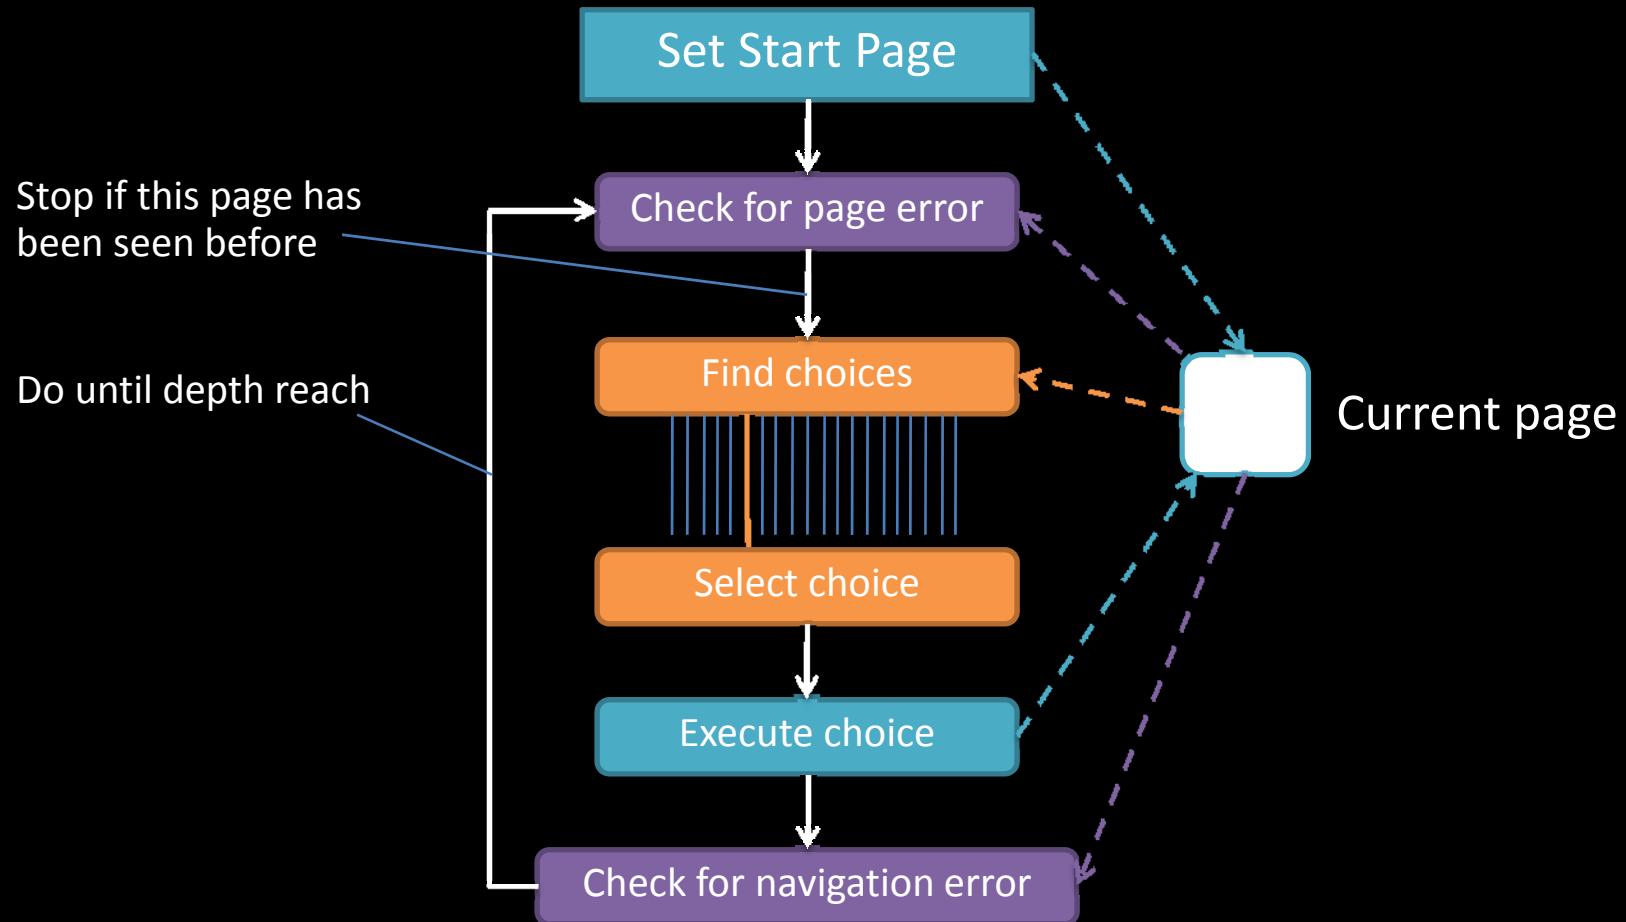

```
currentPage = Navigator.load(startingURL);
while (true) {
    error = ErrorHandler(currentPage,constraints);
    if (error.status==true)
        VeriSoft.assert(currentPage,error);
    if (this page has been seen before)
        VeriSoft.abort(currentPage,``cycle");
    else {
        choices = ChoiceFinder(currentPage);
        selectedChoice = VeriSoft.toss(choices);
        currentPage = Navigator.execute(selectedChoice,choices);
        if (currentPage.error != null)
            VeriSoft.assert(currentPage,error);
    }
}
```

}

} Page Error

} Navigation Error

# 5.1 Exploration Algorithm

## 5.2 Controlling the search

- Filtering
  - ignore “unimportant” actions
  - e.g. links to PDF , Word documents, external sites, mailto links, etc.
- Cycle detection
  - State vs. stateless: page that look identical may represent different states.
  - e.g., the initial page of Amazon with and without cookies
  - Configurable cycle-detection

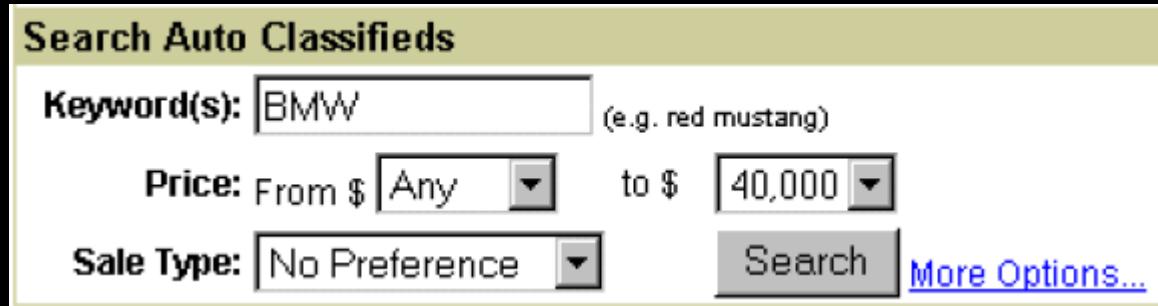

# 6. Automatically filling forms

Search Auto Classifieds

Keyword(s):  (e.g. red mustang)

Price: From \$  to \$

Sale Type:  [Search](#) [More Options...](#)

How to fill this form automatically?

Tester needs to provide some information!

# 6.1 Smart Profiles

Information used to fill in forms

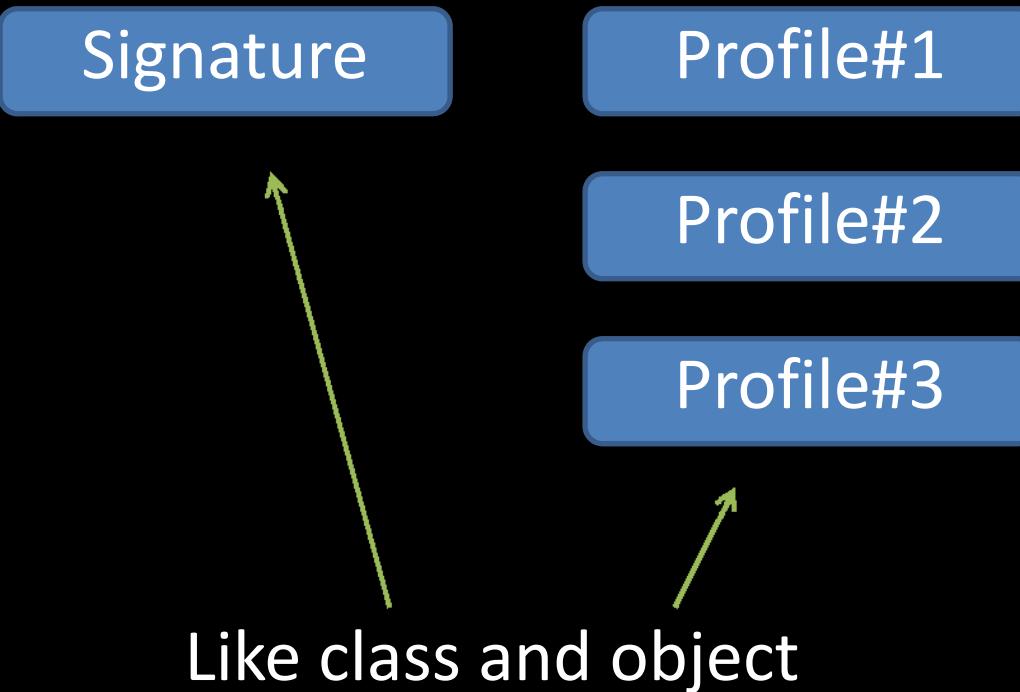

1. Data model level
  - Not form-by-form approach
  - e.g. car sale site
    - Specify a dataset that describe
      - Customer profiles
      - Car models or properties
2. As light-weight as possible
3. independent of the structure of the Web site
4. reusable as structure of Web site changes

# 6.1 Smart Profiles

## XML Schema

```
<!DOCTYPE smartprofile [  
  <!ELEMENT smartprofile (signature* |  
    profile*)>  
  <!ELEMENT signature (name, field+)>  
  <!ELEMENT field (name,synonym)>  
  <!ATTLIST field key CDATA>  
  <!ELEMENT profile (name, signature,  
    fieldvalue+)>  
  <!ELEMENT fieldvalue (name,regexp)>  
  <!ELEMENT regexp (#PCDATA) >  
  <!ELEMENT name (#PCDATA)>  
  <!ELEMENT synonym (#PCDATA)>  
>]
```

## 6.1 Smart Profiles

# 6.1 Smart Profiles

## Signature

```
<signature>
  <name> CarType </name>
  <field key=true>
    <name> Make </name>
    <synonym> *carmake* </synonym>
  </field>
  <field key=false>
    <name> Model </name>
  </field>
  <field key=false>
    <name> Year </name>
  </field>
  <field key=false>
    <name> Interior </name>
  </field>
  <field key=false>
    <name> Type </name>
  </field>
</signature>
```

## Profile

```
<profile>
  <name> Rolls </name>
  <signature> CarType </signature>
  <fieldvalue>
    <name> Make </name>
    <regexp> Rolls-Royce </regexp>
  </fieldvalue>
  <fieldvalue>
    <name> Model </name>
    <regexp> *Corniche* </regexp>
  </fieldvalue>
  <fieldvalue>
    <name> Year </name>
    <regexp> 2002 </regexp>
  </fieldvalue>
  <fieldvalue>
    <name> Type </name>
    <regexp> Convertible* </regexp>
  </fieldvalue>
</profile>
```

## 6.2 Filling out forms

### 1. Form Analysis

- Generate field name for every field
- Output = Form schema

### 2. Form Matching

- Match form schema to smart profiles
- Output = Candidate profiles

### 3. Form Completion

- Match value in candidate profile with field

## 6.3 More

- Creating profiles is an iterative process
  - System prompts tester for missing information
    - Unknown field

## 7. Conclusion

As web sites became more complex and change rapidly, we need some automatic and robust way to test them

Contributions of this paper are

- Infrastructure to automate testing of dynamic Web sites
- Search algorithms for automatically exploring all the paths a user might follow in a Web application
- SmartProfiles as a high-level specification of test data to populate forms
- Automatically filling forms strategy.
