# Decidability of WS1S and S1S (An Exposition) 

William Gasarch-U of MD

## Credit Where Credit is Due

Buchi proved that WS1S was decidable.
I don't know off hand who proved S1S decidable.

## WS1S

PART I OF THIS TALK:
WE DEFINE WS1S AND PROVE ITS DECIDABLE

## Formulas and Sentences

(This is informal since we did not specify the language.)

1. A Formula allows variables to not be quantified over. A Formula is neither true or false. Example: $(\exists x)[x+y=7]$.
2. A Sentence has all variables quantified over. Example: $(\forall y)(\exists x)[x+y=7]$. So a Sentence is either true or false.

## Formulas and Sentences

(This is informal since we did not specify the language.)

1. A Formula allows variables to not be quantified over. A Formula is neither true or false. Example: $(\exists x)[x+y=7]$.
2. A Sentence has all variables quantified over. Example: $(\forall y)(\exists x)[x+y=7]$. So a Sentence is either true or false. WRONG- need to also know the domain.
$(\forall y)(\exists x)[x+y=7]$ - TRUE if domain is $Z$, the integers.
$(\forall y)(\exists x)[x+y=7]$ - FALSE if domain is $N$, the naturals.

## Variables and Symbols

In our lang

1. The logical symbols $\wedge, \neg,(\exists)$.
2. Variables $x, y, z, \ldots$ that range over $N$.
3. Variables $A, B, C, \ldots$ that range over finite subsets of $N$.
4. Symbols: $<, \in$ (usual meaning), $S$ (meaning $S(x)=x+1$ ).
5. Constants: $0,1,2,3, \ldots$
6. Convention: We write $x+c$ instead of $S(S(\cdots S(x)) \cdots)$. NOTE: + is NOT in our lang.
Called WS1S: Weak Second order Theory of One Successor. Weak Second order means quantify over finite sets.

## What Does One Successor Mean?

OUR basic objects are NUMBERS. View as UNARY strings, elements of $1^{*}$. SUCC is APPEND 1. So could view $7=((5$ CONCAT 1$)$ CONCAT 1$)$.

WHAT IF our basic objects were STRINGS in $\{0,1\}^{*}$ ? Would have TWO SUCC's: APPEND0, APPEND1.

WS1S = Weak Second Order with ONE Successor- just one way to add to a string. Basic objects are strings of 1's.

WS2S = Weak Second order with TWO Successors- two ways to add to a string. Basic objects are strings of 0's and 1's.

WS2S is also decidable but we will not prove this.

## Atomic Formulas

An Atomic Formulas is:

1. For any $c \in N, x=y+c$ is an Atomic Formula.
2. For any $c \in N, x<y+c$ is an Atomic Formula.
3. For any $c, d \in \mathrm{~N}, x \equiv y+c(\bmod d)$ is an Atomic Formula.
4. For any $c \in N, x+c \in A$ is an Atomic Formula.
5. For any $c \in \mathrm{~N}, A=B+c$ is an Atomic Formula.

## WS1S Formulas

A WS1S Formula is:

1. Any atomic formula is a WS1S formula.
2. If $\phi_{1}, \phi_{2}$ are WS1S formulas then so are
$2.1 \phi_{1} \wedge \phi_{2}$,
$2.2 \phi_{1} \vee \phi_{2}$
$2.3 \neg \phi_{1}$
3. If $\phi\left(x_{1}, \ldots, x_{n}, A_{1}, \ldots, A_{m}\right)$ is a WS1S-Formula then so are
$3.1\left(\exists x_{i}\right)\left[\phi\left(x_{1}, \ldots, x_{n}, A_{1}, \ldots, A_{m}\right)\right]$
$3.2\left(\exists A_{i}\right)\left[\phi\left(x_{1}, \ldots, x_{n}, A_{1}, \ldots, A_{m}\right)\right]$

## PRENEX NORMAL FORM

A formulas is in Prenex Normal Form if it is of the form

$$
\left(Q_{1} v_{1}\right)\left(Q_{2} v_{2}\right) \cdots\left(Q_{n} v_{m}\right)\left[\phi\left(v_{1}, \ldots, v_{n}\right)\right]
$$

where the $v_{i}$ 's are either number of finite-set variables, and $\phi$ has no quantifiers. (There are $m$ quantifiers and $n \geq m$ variables since this is a formula- there could be variables that are not quantified over.)
Every formula can be put into this form using the following rules

1. $(\exists x)\left[\phi_{1}(x)\right] \vee(\exists y)\left[\phi_{2}(y)\right]$ is equiv to $(\exists x)\left[\phi_{1}(x) \vee \phi_{2}(x)\right]$.
2. $(\forall x)\left[\phi_{1}(x)\right] \wedge(\forall y)\left[\phi_{2}(y)\right]$ is equiv to $(\forall x)\left[\phi_{1}(x) \wedge \phi_{2}(x)\right]$.
3. $\phi(x)$ is equivalent to $(\forall y)[\phi(x)]$ and $(\exists y)[\phi(x)]$.

## KEY DEFINITION

Definition: If $\phi\left(x_{1}, \ldots, x_{n}, A_{1}, \ldots, A_{m}\right)$ is a WS1S-Formula then $T R U E_{\phi}$ is the set

$$
\left\{\left(x_{1}, \ldots, x_{n}, A_{1}, \ldots, A_{m}\right) \mid \phi\left(x_{1}, \ldots, x_{n}, A_{1}, \ldots, A_{m}\right)=T\right\}
$$

This is the set of $\left(x_{1}, \ldots, x_{n}, A_{1}, \ldots, A_{m}\right)$ that make $\phi$ TRUE.

## REPRESENTATION

We want to say that $T R U E$ is regular. Need to represent $\left(x_{1}, \ldots, x_{n}, A_{1}, \ldots, A_{m}\right)$.
We just look at $(x, y, A)$. Use the alphabet $\{0,1\}^{3}$.
Below: Top line and the $x, y, A$ are not there- Visual Aid.
The triple (3, 4, $\{0,1,2,4,7\}$ ) is represented by

|  | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $x$ | 0 | 0 | 0 | 1 | $*$ | $*$ | $*$ | $*$ |
| $y$ | 0 | 0 | 0 | 0 | 1 | $*$ | $*$ | $*$ |
| $A$ | 1 | 1 | 1 | 0 | 1 | 0 | 0 | 1 |

Note: After we see 0001 for $x$ we DO NOT CARE what happens next. The *'s can be filled in with 0's or 1's and the string of symbols from $\{0,1\}^{3}$ above would still represent $(3,4,\{0,1,2,4,7\})$.

## REPRESENTATION-MORE FORMAL

The number $n$ is represented by $0^{n} 1\{0,1\}^{*}$.
Finite set $A$ is represented by a string in $\{0,1\}^{*}$ which is its bit-vector.

## Example And Our Alphabet

Consider the set

$$
\{(x, y, A) \mid x=y+1 \text { and } y \in A\}
$$

We want to show that its regular. Here is an example of how we represent a tuple (number, number,finite set):

|  | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| :---: | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $x$ | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |
| $y$ | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 1 |
| $A$ | 1 | 1 | 1 | 0 | 1 | 0 | 0 | 1 |

This string is IN our lang since $x=5, y=4$, and $A=\{0,1,2,4,7\}$.

Note that the ALPHABET is itself complicated- its

$$
\{000,001,010,011,100,101,110,111\}
$$

though we think of it vertically rather than horizontally.

## STUPID STRINGS

What does

|  | 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $x$ | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| $y$ | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 1 |
| $A$ | 1 | 1 | 1 | 0 | 1 | 0 | 0 | 1 |

represent?
This string is STUPID! There is no value for $x$ This string does not represent anything!

Our DFA's will have THREE kinds of states: ACCEPT, REJECT, and STUPID. STUPID means that the string did not represent anything because it has a number-variable be all 0 's. (It is fine for a set var to be all 0's- that would be the empty set.)

## KEY THEOREM

Theorem: For all WS1S formulas $\phi$ the set $T R U E_{\phi}$ is regular.
We proof this by induction on the formation of a formula. If you prefer- induction on the LENGTH of a formula.

## THEOREM FOR ATOMIC FORMULAS

Lemma: For all WS1S ATOMIC formulas $\phi$ the set $T R U E_{\phi}$ is regular.

We prove in class, but not hard.

## THEOREM FOR FORMULAS (I)

Assume true for $\phi_{1}, \phi_{2}$ - so $T R U E_{\phi_{1}}$ and $T R U E_{\phi_{2}}$ are REG.

1. $T R U E_{\phi_{1} \wedge \phi_{2}}=T R U E_{\phi_{1}} \cap T R U E_{\phi_{2}}$.
2. $T R U E_{\phi_{1} \vee \phi_{2}}=T R U E_{\phi_{1}} \cup T R U E_{\phi_{2}}$.
3. $T R \cup E_{\neg \phi_{1}}=\Sigma^{*}-\left(T R U E_{\phi_{1}} \cup\right.$ Stupid Strings $)$.

Good News!: All of the above can be shown using the Closure properties of Regular Langs.

Not Bad News But a Caveat: Must be do carefully because of the stupid states. (Stupid is as stupid does. Name that movie reference!)

Next slides for what to do about quantifiers.

## THEOREM FOR FORMULAS (II)

$T R U E_{\phi\left(x_{1}, \ldots, x_{n}, A_{1}, \ldots, A_{m}\right)}$ is regular.
We want $\operatorname{TRUE} E_{\left(\exists x_{1}\right)\left[\phi\left(x_{1}, \ldots, x_{n}, A_{1}, \ldots, A_{m}\right)\right]}$ is regular. Ideas?

## THEOREM FOR FORMULAS (II)

$T R U E E_{\phi\left(x_{1}, \ldots, x_{n}, A_{1}, \ldots, A_{m}\right)}$ is regular.
We want $\operatorname{TRUE}_{\left(\exists x_{1}\right)\left[\phi\left(x_{1}, \ldots, x_{n}, A_{1}, \ldots, A_{m}\right)\right]}$ is regular. Ideas?
Use NONDETERMINISM.
Will show you in class.

## DFA DECIDABILITY THEOREM

We need the following easy theorem:
Theorem: The following problem is decidable: given a DFA determine if it accepts ANY strings.

## DFA DECIDABILITY THEOREM PROOF

Theorem: The following problem is decidable: given a DFA determine if it accepts ANY strings.
WILL BE ON A HOMEWORK.

## DECIDABILITY OF WS1S

Theorem: WS1S is Decidable. Proof:

1. Given a SENTENCE in WS1S put it into the form

$$
\left(Q_{1} A_{1}\right) \cdots\left(Q_{n} A_{n}\right)\left(Q_{n+1} x_{1}\right) \cdots\left(Q_{n+m} x_{m}\right)\left[\phi\left(x_{1}, \ldots, x_{m}, A_{1}, \ldots, A_{n}\right)\right]
$$

2. Assume $Q_{1}=\exists$. (If not then negate and negate answer.)
3. View as $(\exists A)[\phi(A)]$, a FORMULA with ONE free var.
4. Construct DFA $M$ for $\{A \mid \phi(A)$ is true $\}$.
5. Test if $L(M)=\emptyset$.
6. If $L(M) \neq \emptyset$ then $(\exists A)[\phi(A)]$ is TRUE. If $L(M)=\emptyset$ then $(\exists A)[\phi(A)]$ is FALSE.

## An Example

We will do the following TOGETHER

$$
(\exists A)(\exists x)(\forall y)[x \in A \wedge x \geq 2 \wedge(y>x \vee y \notin A)]
$$

We need DFA's for the following:

1. $\{(x, y, A) \mid x \in A\}$
2. $\{(x, y, A) \mid x \geq 2\}$
3. $\{(x, y, A) \mid y>x\}$
4. $(\{(x, y, A) \mid y \notin A\}$

## Atomic Formulas we Need

We get DFA's for the following in order, using the prior ones to get the later ones.

1. $\{(x, y, A) \mid x \in A \wedge x \geq 2\}$
2. $\{(x, y, A) \mid y>x \vee y \notin A\})$
3. $\{(x, y, A) \mid x \in A \wedge x \geq 2 \wedge(y>x \vee y \notin A)\})$
4. $\{(x, y, A) \mid \neg[x \in A \wedge x \geq 2 \wedge(y>x \vee y \notin A)]\}$

NOTE- we don't use de Morgans Law- we just complement the DFA.

## Atomic Formulas we Need

We have a DFA for

$$
\{(x, y, A) \mid \neg[x \in A \wedge x \geq 2 \wedge(y>x \vee y \notin A)]\}
$$

We get DFA's for the following by projection and complimentation.

1. $\{(x, A) \mid(\exists y) \neg[x \in A \wedge x \geq 2 \wedge(y>x \vee y \notin A)]\}$
2. $\{(x, A) \mid \neg(\exists y) \neg[x \in A \wedge x \geq 2 \wedge(y>x \vee y \notin A)]\}$
3. $\{A \mid(\exists x) \neg(\exists y) \neg[x \in A \wedge x \geq 2 \wedge(y>x \vee y \notin A)]\}$

## The Finale!

Take the DFA for

$$
\{A \mid(\exists x) \neg(\exists y) \neg[x \in A \wedge x \geq 2 \wedge(y>x \vee y \notin A)]\}
$$

TEST it- does it accept ANYTHING?
If YES then the original sentence is TRUE.
If NO then the original sentence is FALSE.

## COMPLEXITY OF THE DECISION PROCEDURE

Given a sentence
$\left(Q_{1} A_{1}\right) \cdots\left(Q_{n} A_{n}\right)\left(Q_{n+1} x_{1}\right) \cdots\left(Q_{n+m} x_{m}\right)\left[\phi\left(x_{1}, \ldots, x_{m}, A_{1}, \ldots, A_{n}\right)\right]$
How long will the procedure above take in the worst case?:

## COMPLEXITY OF THE DECISION PROCEDURE

Given a sentence
$\left(Q_{1} A_{1}\right) \cdots\left(Q_{n} A_{n}\right)\left(Q_{n+1} x_{1}\right) \cdots\left(Q_{n+m} x_{m}\right)\left[\phi\left(x_{1}, \ldots, x_{m}, A_{1}, \ldots, A_{n}\right)\right]$
How long will the procedure above take in the worst case?:
$2^{2 \cdots n}$ steps since we do $n$ nondet to det transformations.
VOTE:

1. There are much better algorithms.
2. $2^{2 \cdots n}$ steps is provably the best you can do (roughly).
3. Complexity of dec of WS1S is unknown to science!

## COMPLEXITY OF THE DECISION PROCEDURE

Given a sentence
$\left(Q_{1} A_{1}\right) \cdots\left(Q_{n} A_{n}\right)\left(Q_{n+1} x_{1}\right) \cdots\left(Q_{n+m} x_{m}\right)\left[\phi\left(x_{1}, \ldots, x_{m}, A_{1}, \ldots, A_{n}\right)\right]$
How long will the procedure above take in the worst case?:
$2^{2 \cdots n}$ steps since we do $n$ nondet to det transformations.
VOTE:

1. There are much better algorithms.
2. $2^{2 \cdots n}$ steps is provably the best you can do (roughly).
3. Complexity of dec of WS1S is unknown to science!

And the answer is: Can do "better": $2^{2^{n^{3}} \log n}$. AND this is provably the best you can do (roughly).

## CAN ANYTHING INTERESTING BE STATED IN WS1S?

Is there interesting problems that can be STATED in WS1S? VOTE:

1. YES
2. NO

## CAN ANYTHING INTERESTING BE STATED IN WS1S?

Is there interesting problems that can be STATED in WS1S?
VOTE:

1. YES
2. NO

Depends what you find interesting.
YES: Extensions of WS1S are used in low-level verification of code fragments. The MONA group has coded this up and used it, though there code uses MANY tricks to speed up the program in MOST cases.

NO: There are no interesting MATH problems that can be expressed in WS1S.

## PRESBURGER ARITHMETIC

In our lang

1. The logical symbols $\wedge, \vee, \neg,(\exists),(\forall)$.
2. Variables $x, y, z, \ldots$ that range over $N$.
3. Symbols: $<,+$. Constants: $0,1,2,3, \ldots$

Terms and Formulas:

1. Any variable or constant is a term.
2. $t_{1}, t_{2}$ terms then $t_{1}+t_{2}$ is term.
3. $t_{1}, t_{2}$ terms then $t_{1}=t_{2}, t_{1}<t_{2}$ are atomic formulas.
4. Other formulas in usual way: $\wedge, \vee, \neg,(\exists),(\forall)$.

Presb Arith is decidable by TRANSFORMING Pres Arith Sentences into WS1S sentences.
Presb Arithmetic has been used in Code Optimization (using a better dec procedure than reducing to WS1S).

## S1S

PART II OF THIS TALK:
WE DEFINE S1S AND PROVE ITS DECIDABLE

## What is S1S?

Whats The Same: We use the same symbols and define formulas and sentences the same way
Whats Different: We interpret the set variables as ranging over ANY set of naturals, including infinite ones.
Question: Can we still use finite automata?

## Essence of WS1S proof

Essence of WS1S proof:

1. Reg langs closed: UNION, INTER, COMP, PROJ.
2. Emptyness problem for DFA's is decidable.

KEY: We never actually RAN a DFA on any string.
Definition: A $B$-NDFA as an NDFA. If $x \in \Sigma^{\omega}$ then $x$ is accepted by $B$-NDFA $M$ if there is a path such that $M(x)$ hits a final state inf often.

## Good News: (PROVE IN GROUPS)

1. B-reg closed: UNION, INTER, PROJ
2. emptyness problem for $B$-NDFA's is decidable.

NEED $B$-reg closed under complementation.

## GOOD NEWS EVERYONE!

GOOD NEWS: B-reg IS closed under Complementation. GOOD NEWS: That is ALL we need to get S1S decidable. GOOD NEWS: It's the only hard step!
GOOD NEWS: CMSC 452: We are DONE!
GOOD NEWS: CMSC 858/Math 608 you'll see proof!
GOOD NEWS: CMSC 858/Math 608 proof uses

## GOOD NEWS EVERYONE!

GOOD NEWS: B-reg IS closed under Complementation. GOOD NEWS: That is ALL we need to get S1S decidable. GOOD NEWS: It's the only hard step!
GOOD NEWS: CMSC 452: We are DONE!
GOOD NEWS: CMSC 858/Math 608 you'll see proof!
GOOD NEWS: CMSC 858/Math 608 proof uses Ramsey Theory!

## GOOD NEWS EVERYONE!

GOOD NEWS: $B$-reg IS closed under Complementation. GOOD NEWS: That is ALL we need to get S1S decidable. GOOD NEWS: It's the only hard step!
GOOD NEWS: CMSC 452: We are DONE!
GOOD NEWS: CMSC 858/Math 608 you'll see proof!
GOOD NEWS: CMSC 858/Math 608 proof uses Ramsey Theory! DISCLAIMER: We ended up not doing it in CMSC 858/Math 608 after all. Too messy.

## $B$-Reg and $M u$-Reg

Definition: A $M u$-aut $M$ is a $(Q, \Sigma, \delta, s, \mathcal{F})$ where $Q, \Sigma, \delta, s$ are as usual but $\mathcal{F} \subseteq 2^{Q}$. That is $\mathcal{F}$ is a set of sets of states. $M$ accepts $x \in \Sigma^{\omega}$ if when you run $M(x)$ the set of states visited inf often is in $\mathcal{F}$.
Easy (IN GROUPS): $M u$-reg Closed: UNION, INTER, COMP.

## PLAN

RECAP and PLAN:

- B-reg easily closed: UNION, INTER, PROJ. But COMP seems hard.
- Mu-reg easily closed: UNION, INTER, COMP. But PROJ seems hard.
- Our plan if we were to do the entire proof: Show $B$-reg $=$ Mu-reg.

## DECIDABILITY OF S1S

Theorem: S1S is Decidable. Proof:

1. Given a SENTENCE in S1S put it into the form

$$
\left(Q_{1} A_{1}\right) \cdots\left(Q_{n} A_{n}\right)\left(Q_{n+1} x_{1}\right) \cdots\left(Q_{n+m} x_{m}\right)\left[\phi\left(x_{1}, \ldots, x_{m}, A_{1}, \ldots, A_{n}\right)\right]
$$

2. Assume $Q_{1}=\exists$. (If not then negate and negate answer.)
3. View as $(\exists A)[\phi(A)]$, a FORMULA with ONE free var.
4. Construct B-NDFA $M$ for $\{A \mid \phi(A)$ is true $\}$.
5. Test if $L(M)=\emptyset$.
6. If $L(M) \neq \emptyset$ then $(\exists A)[\phi(A)]$ is TRUE. If $L(M)=\emptyset$ then $(\exists A)[\phi(A)]$ is FALSE.

## COMPLEXITY OF THE DECISION PROCEDURE

Given a sentence

$$
\left(Q_{1} A_{1}\right) \cdots\left(Q_{n} A_{n}\right)\left(Q_{n+1} x_{1}\right) \cdots\left(Q_{n+m} x_{m}\right)\left[\phi\left(x_{1}, \ldots, x_{m}, A_{1}, \ldots, A_{n}\right)\right]
$$

How long will the procedure above take in the worst case?
$2^{2 \cdots n}$ steps since we do $n$ nondet to det transformations. (This is not quite right- there are some log factors as well.)

## CAN ANYTHING INTERESTING BE STATED IN S1S?

Is there interesting problems that can be STATED in S1S?
YES: Verification of programs that are supposed to run forever like Operating systems. Verification of Security protocols.
NO: There are no interesting MATH problems that can be expressed in S1S.

## EXTENSIONS

WS1S and S1S are about strings of the form $0^{*} 1$ and sets of such strings.

WS2S and S2S are about strings of the form $\{0,1\}^{*}$ and sets of such strings.

CAN ANYTHING INTERESTING BE STATED IN WS2S or S2S:
WS2S: YES for verification, no for mathematics.
S2S: YES for Mathematics (finally!). Verification- probably.
I do not think S2S has ever been coded up.
